SUMMARY

End-grain photographs are presented of 393 woods of Euphorbiaceae from the wood collection of the Utrecht University branch of the Nationaal Herbarium Nederland (Uw). Close to half of the total number of woody genera of Euphorbiaceae in the wide sense are represented. The photographs are intended as an aid in hand-lens inspection and identification of wood.

Key words: Euphorbiaceae, wood characters, end-grain, hand-lens images.

INTRODUCTION

The idea of presenting this assortment of end-grain photographs of Euphorbiaceae woods finds its roots in an inventory of the collection of microscope slides which forms part of the large wood collection at the Utrecht University branch of the Nationaal Herbarium Nederland (NHN). This inventory was carried out by M.E. Bakker from 1999–2001, and involved, among others, making digital images of over 6000 slides. These images can now be viewed on the website of the NHN (<http://www.nationaalherbarium.nl>), and high resolution copies are available on request.

End-grain reproductions conforming to the low magnification of an ordinary hand-lens (8–12 \times) bridge the gap, so to speak, between the unaided eye and the microscope. The advantage of these images lies in the fact that they correspond to the practice of lens inspection, the usual approach in identifying an unknown wood sample. For a considerable time this type of photographs used to illustrate local timber floras. A good example is the “Bomenboek voor Suriname” (Lindeman, Mennega & Hekking 1963). Later on, however, microphotographs of sections prevailed in anatomical treatments.

A revival of the use of end-grain pictures, however, can be found in for instance J. Ilic’s “CSIRO Atlas of Hardwoods” (1991). In this book, consisting of two parts: a Macro-atlas and a Micro-atlas, the Macro-part deals with end-grain pictures at a 10 \times magnification. Though the Euphorbiaceae (s.l.) are well represented by 40 genera, it nevertheless seemed worthwhile, in view of the large total number of woody genera (> 300) recognized in the family, to present a volume based on taxa represented in the Utrecht wood collection. This involves nearly 150 genera, and forms another tribute to the diversity of wood structure within the Euphorbiaceae in the wide sense.

ABOUT THE BOOK

While we have tried to give as wide a coverage as possible, practical reasons dictated us to limit ourselves to wood samples with a clean-cut cross section surface already available. Consequently, some genera are not or only poorly represented, while other genera, in particular large ones, are represented by several species, sometimes taking up an entire page or more (e.g. *Croton*, *Sapium*). In a number of cases two photographs of the same object are offered: the second photograph is an enlargement of a part of the first. This we did in order to make the structure more clear in blocks with a surface showing only a poor contrast and/or little detail of the elements at the standard magnification, usually due to a very dense structure (fine grain).

As is customary in this kind of atlases, the sequence of the pictures is alphabetical by plant name. The nomenclature as laid down in recent taxonomic treatments cited here has been followed. Due to circumstances, we used the old spelling in our list in two cases (*Coelodepas* = *Koilodepas*, and *Hyeronima* = *Hieronyma*). Because of the alphabetical sequence, leafing through the pages will not lay bare information on taxonomic relationships, but will focus the eye on the great variety of patterns in the first place. In the figure legends both the name of the plant and the Uw number are given. The Uw numbers provide the link with the other data given in the list of material.

The family is taken in the old wide sense (Webster 1994a, b), including the often disputed Pandaceae, and the more recently reinstated Phyllanthaceae, Picrodendraceae, and Putranjivaceae. Molecular research of recent years indicates that the concept of the family in the traditional wide sense will have to undergo changes (Wurdack & Chase 1999, 2002). This research is still ongoing, and the time for a new, stable classification seems not to have arrived yet. In Webster's classificaton (1994a,b) five subfamilies are recognized in the family. Two of them, Phyllanthoideae and Oldfieldioideae, represent the biovulate taxa, while Acalyphoideae, Crotonoideae, and Euphorbioideae represent the uniovulate taxa (the latter three subfamilies constituting Euphorbiaceae s.str.). Within the last two decades overviews of the wood anatomy of three of these subfamilies were published, viz. Oldfieldioideae (Hayden 1994), Acalyphoideae (Hayden & Hayden 2000), and Phyllanthoideae (Mennega 1987), while an overview of Euphorbioideae is forthcoming (Mennega in prep.).

These wood anatomical studies so far have shown a great variety in structure among taxa in the biovulate subfamilies, while uniovulate genera tend to have a more or less identical pattern. Disputed genera, e.g. *Bischofia* (Fig. 13c), *Dicoelia* (Fig. 28b), *Galearia* (Fig. 36f, 37a–d), *Martretia* (Fig. 53f), *Panda* (Fig. 59a), or *Pentabrachion* (Fig. 61e, f), do not manifest themselves as out of place in their respective subfamilies.

MATERIAL AND METHODS

A list of all photographed specimens arranged by the Uw (Utrecht wood collection) numbers is given on pages 27–110.

For photography, small wood blocks were used that previously had been cut to size and treated in order to enable microtome sectioning. The flat surface left after the cutting of microtome slices was photographed using a Zeiss Luminar 40 mm f/4.5 macro objective (stopped down $\frac{1}{2}$ stop) on Kodachrome 25 film. All objects were photographed at a standard repro ratio of 5 : 1. Thus an image on the 35 mm film frame represents a rectangle of $\pm 7 \times 4.5$ mm on the object. When viewed from a normal reading distance (25–30 cm = 10–12 in.), the printed images should correspond to images seen through a hand-lens with a magnification of $\geq 10\times$. Additional photographs at higher magnification were taken at repro ratios of 10 : 1 or 15 : 1, using Zeiss Luminar 25 mm f/3.5, and 16 mm f/2.5 macro objectives, respectively (also stopped down $\frac{1}{2}$ stop). From the original colour slides digital scans were made for further processing.

WHAT INFORMATION CAN BE RETRIEVED FROM THE PHOTOGRAPHS?

For the ultimate identification of a wood sample, sections in three planes are needed, and examination should also include high magnification images through a microscope. When working with a hand-lens, most information will generally be obtained from examining a cross section. Tangential and radial sections normally will yield their secrets only under the microscope, bar exceptions in some plant families. For that reason we did not include photographs of longitudinal sections in this atlas. Admittedly, also a

picture of a cross section at the low magnification of a hand-lens offers only restricted information as compared to the higher power images from a microscope. Nevertheless, as the photographs show, variation is evident even then in, e.g., size and arrangement of vessels, distribution of axial parenchyma, characteristics of rays, and the ground tissue consisting of fibres. Or, in other words, patterns characteristic for a genus or groups of related genera due to combination and variation of the elements composing the wood can become apparent even to the field worker equipped with no more than a good hand-lens and a sharp knife. Also preliminary quick identifications down to family or infrafamilial level, for instance in making inventories, will often be possible.

The black-and-white reproductions offered here do not show colour gradations which can be observed in wood samples, and which are captured in the original colour slides. Most samples are light brown to brown, and will accordingly be seen in shades of gray. Very dark wood is not common in Euphorbiaceae. A marked difference between sapwood and heartwood is rarely seen. In specimens of some genera tangential banding patterns of lighter and darker zones, often attractive, catch the eye (e.g. Fig. 2d,e, Fig. 76a,b, Fig. 81e,f, Fig. 82a,b). In a number of cases dark discolorations resembling irregular lines or flames were noticed, usually still apparent in black-and-white prints (see, for example, Fig. 24a, Fig. 81a,d). These appear to be artifacts (not restricted to Euphorbiaceae only!), mostly being the result of fungal attacks, and have no relation to taxonomic affinity.

For those not familiar with terms used in wood anatomy we refer to the "IAWA list of microscopic features for hardwood identification" which contains detailed definitions, descriptions, and illustrations of individual wood characters (IAWA Committee 1989).

Growth rings

As most woody Euphorbiaceae grow in the tropics, growth rings seldom are a striking feature. If present, the boundaries are mostly indicated by a narrow vesselless zone or by a different parenchyma distribution (see, for example, Fig. 31b,c, Fig. 44e, Fig. 75c–e, Fig. 76a, b). Well-marked growth rings, indicated by suddenly enlarged vessels, are present in *Acalypha cincta* (Fig. 1a), some species of *Phyllanthus* (Fig. 64c, Fig. 66b, c) and *Sapium glandulosum* p.p. (Fig. 73a). In the two specimens of *Tetracoccus* (Fig. 81e,f, Fig. 82a, b) large vessels are prominently distributed in concentric rings which might be related to seasonal growth. Strikingly, a specimen of *Flueggea suffruticosa* from a plant cultivated in a Dutch greenhouse shows very marked growth rings formed by change in both parenchyma and vessel distribution (Fig. 36b), in contrast to the other specimens which are all of non-temperate origin. In these there is a very slight tendency toward growth rings at most, e.g. *Flueggea acidoton* (Fig. 35c, d) and *F. leucopyrus* (Fig. 35f).

Vessels

More important information can be gained from the vessels by their distribution, size and numbers. A feature characteristic for many genera are the short to long radial multiples, often with some flattened vessels in the middle of the rows (see, for instance,

Balakata, Fig. 12d–f, *Conceveiba*, Fig. 22c–e, 23a–f, *Croton*, Fig. 24–27, *Grossera*, Fig. 39b, *Mabea*, Fig. 48, *Senefelderopsis*, Fig. 77f). Often there is a noticeable tendency towards a radial pattern of vessels and vessel multiples (e.g., *Chamaesyce*, Fig. 17d, e, *Codiaeum*, Fig. 21e–f, *Euphorbia*, Fig. 32e–f, 33a–e, *Strophioblachia*, Fig. 80c, d, *Wielandia*, Fig. 84d, e). A remarkable feature are the radial zones without vessels present in some genera, e.g. *Actinostemon* (Fig. 3c, d), *Necepsia* (Fig. 56d), *Pseudosenefeldera* (Fig. 69c), or *Strophioblachia* (Fig. 80c–d), while in *Rhodothrysus* radial vessel-less zones appear to vary from present, present in part, to absent (Fig. 70c–e). Exclusively solitary vessels are rare (*Hieronyma*, Fig. 44a–e, *Microdesmis*, Fig. 55b, c). The vessel diameter covers a wide range (50–300 µm); however, genera with narrow vessels form the majority. In the climbing taxa *Fragariopsis* (not depicted) and *Plukenetia* (Fig. 68a) very wide solitary vessels co-exist with minute ones in short radial multiples. The number of vessels also varies widely (5–150/sq.mm) and is often inversely related to size. Tyloses can be observed in several genera, with *Hevea* (Fig. 41a–d) and *Pera* (Fig. 62b–f, 63a) as most obvious examples.

Axial parenchyma

Axial parenchyma is present in almost all genera of the uniovulate subfamilies, and in part of the biovulate genera. Most frequently it is distributed in narrow, regular and numerous bands not related to the vessels (e.g. *Borneodendron*, Fig. 14e, *Hevea*, Fig. 41a–d, *Pera*, Fig. 62b–f & 63a–c), or the bands are often interrupted resulting in a reticulate or diffuse-in-aggregates pattern (e.g. *Alchorneopsis*, Fig. 7a–b, *Aleurites*, Fig. 7c–d). Wide bands, like in *Pseudolachnostylis* (Fig. 69a, b), are a rare feature; most extreme is *Piranhea* (Fig. 67c–d), where the parenchyma bands even include most of the vessels (a pattern familiar from many Fabaceae). Also, parenchyma that is clearly associated with the vessels as narrow rings (complete or incomplete), or in wider confluent rings (*Cephalomappa*, Fig. 16e, *Triadica*, Fig. 82f & 83a, *Uapaca*, Fig. 83d–f) seldom occurs. Parenchyma appears to be lacking altogether in a number of genera of the biovulate subfamilies (e.g. *Phyllanthus*, Fig. 64c through Fig. 66f), and exceptionally so in taxa of the uniovulate subfamilies. But even when present, parenchyma may be difficult to spot in the photographs, either because the vessel-associated tissue in particular is scarce, or, as can happen with the banded type, when parenchyma cells and ground tissue fibres have approximately equal size and wall thickness when seen in a cross section. (Note: slightly wetting the surface can help here!)

Rays

Ray features of importance are restricted here to number, width, and the ratio between wide and narrow rays in case both are present (e.g. *Flueggea*, Fig. 35a–f & 36a–d). Most frequently rays are one or two cells wide, and are numerous.

Interspecific variation

At least some impression of interspecific variation can be obtained from the pages devoted to large genera, like, among others, *Croton*, *Drypetes*, *Macaranga*, *Mabea*, and *Sapium*. Generally the pattern between species is conform, showing mainly some

variation in size and number of the vessels. However, caution is in order here, as such differences may also be connected in part to the origin of the sample, i.e., whether from a twig or from the trunk, or result from habitat circumstances.

ACKNOWLEDGEMENTS

The authors wish to thank Mr. Hendrik Rypkema for his careful preparation of the photo-pages. They are most grateful to Dr. Alberta M. W. Mennega for her advice and critical assistance with the preparation of the lists and the text, and to Dr. Peter C. van Welzen of the Leiden University branch of the National Herbarium of the Netherlands, for his assistance in checking data on collections. Thanks are also due to Dr. W.J. Hayden, University of Richmond, Virginia, USA, who kindly put a number of blocks at our disposal. Publication of this photo-atlas was made possible through a grant from the Alberta Mennega Stichting.

LIST OF MATERIAL

The list of wood samples is arranged according to the Uw (Utrecht wood collection) number. The addition of the capital N (in 'UNw') indicates material collected in the Netherlands (whether in the wild or from a cultivated plant). Next to the country of origin, the collector and collection number, and/or the distributing institute, indicated by the standard code of IAWA (Stern 1988), are given. After that a reference to a recent wood anatomical survey of the subfamily concerned (sensu Webster 1994a,b) is provided, including a paper on wood anatomy of the subfamily Euphorbioideae now in the preparatory stage (Mennega 2005 in prep.). Genera belonging to the subfamily Crotonoideae, not yet treated, are indicated by double asterisks. Segregate families are mentioned between square brackets. Further notes on certain numbers can be found at the end of the list.

- 1) The spelling *Hieronyma* has been conserved (Radcliffe-Smith 1994).
- 2) Also regarded as synonymous with *Gymnanthes* (e.g. Webster 1994b).
- 3) Also spelled *Aporusa*. See note by Airy Shaw (1966: p. 380).
- 4) Note by P.C. van Welzen: "All material from Thailand identified as *F. leucopyrus* is referable to *F. virosa* (Roxb. ex Willd.) Voigt. Possibly *F. leucopyrus* is a synonym, but I have not seen material from India." (Van Welzen, pers. comm.).
- 5) There has been confusion about the collector citations Rahmat si Boeea and Rahmat si Toroes, which actually belong to one and the same person. In fact the name 'Rahmat si Toroes' is not correct and the right name should be Rahmat si Boeea, or just 'Boeea'. See also the note in the Cyclopaedia of Collectors in Flora Malesiana (Van Steenis-Kruseman 1950: p. 425–426).
- 6) For a discussion about the spelling, see Airy Shaw (1960).
- 7) Recently also included in *Piranhea* (= *P. mexicana* (Standl.) Radcl.-Sm.).

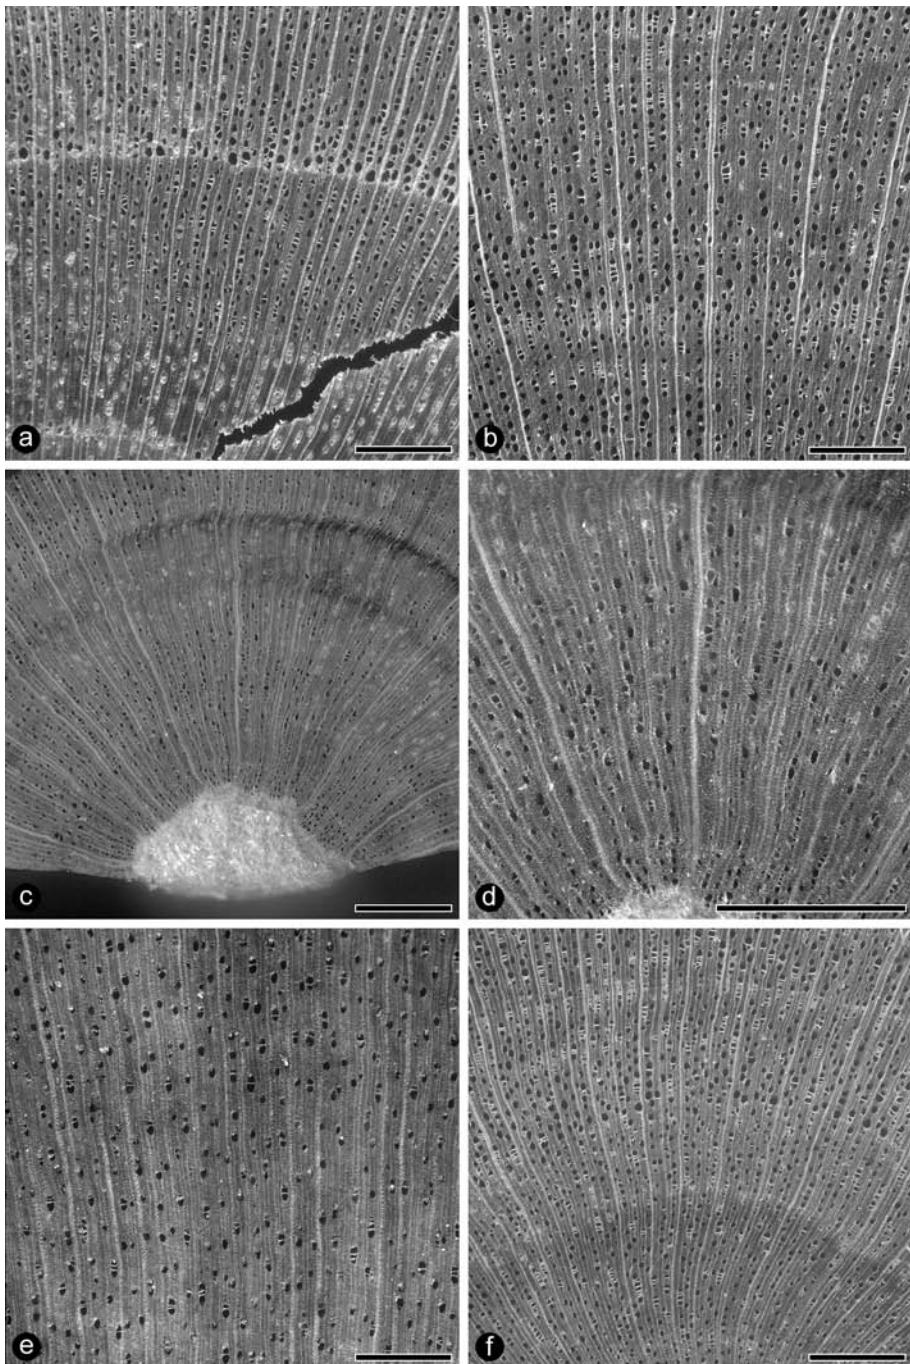

Fig. 1. a: *Acalypha cincta* (Uw 26188). – b: *A. diversifolia* (Uw 12355). – c, d: *A. gracilis* (Uw 13139). – e: *A. macrostachya* (Uw 19652). – f: *A. samydifolia* (Uw 30196). – Bar = 1 mm.

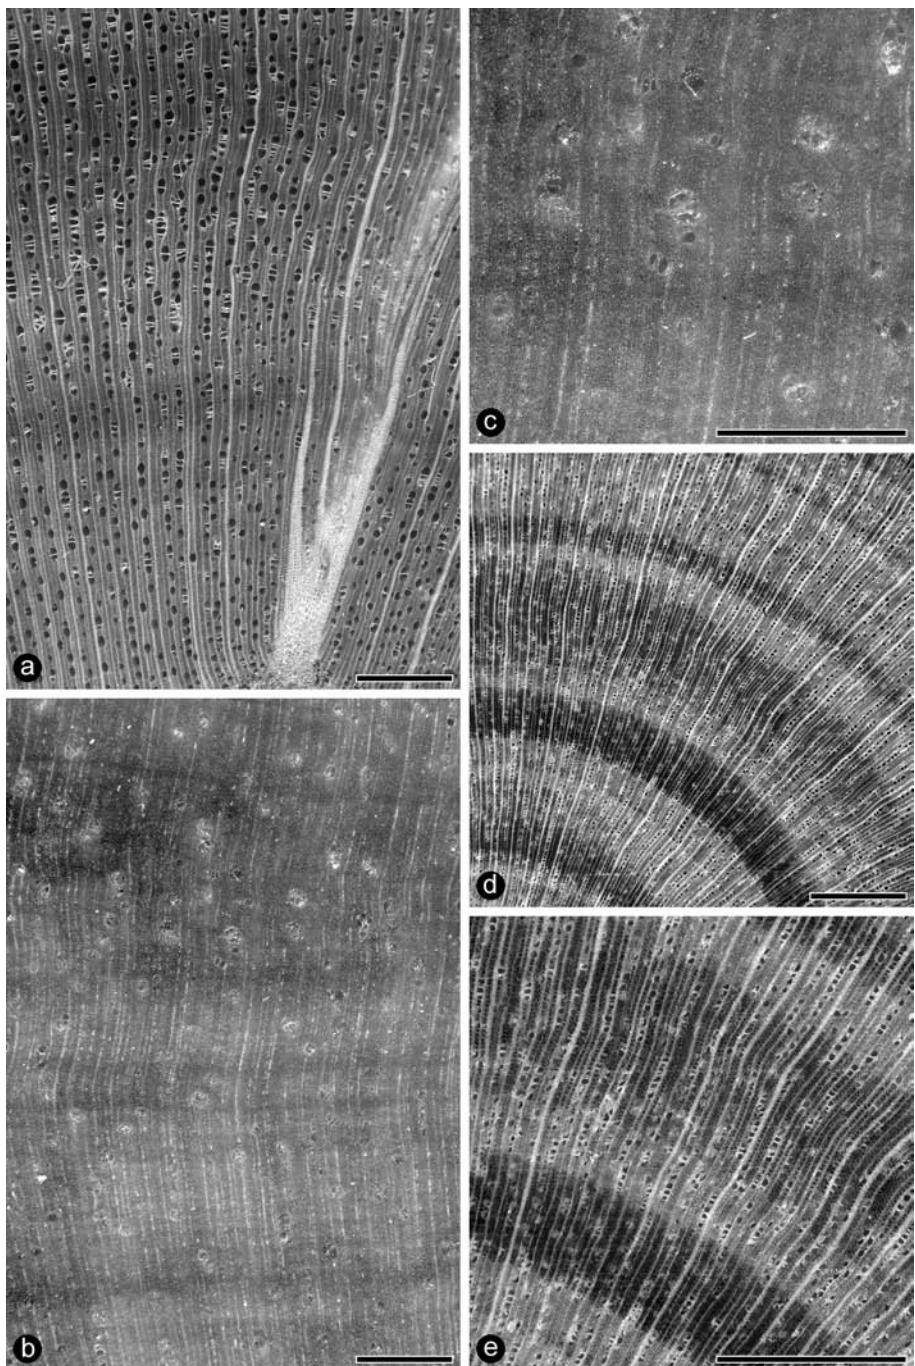

Fig. 2. a: *Acalypha stachyura* (Uw 21085). – b, c: *Acidoton urens* (Uw 8321). – d, e: *Actephila excelsa* (Uw 26296). – Bar = 1 mm.

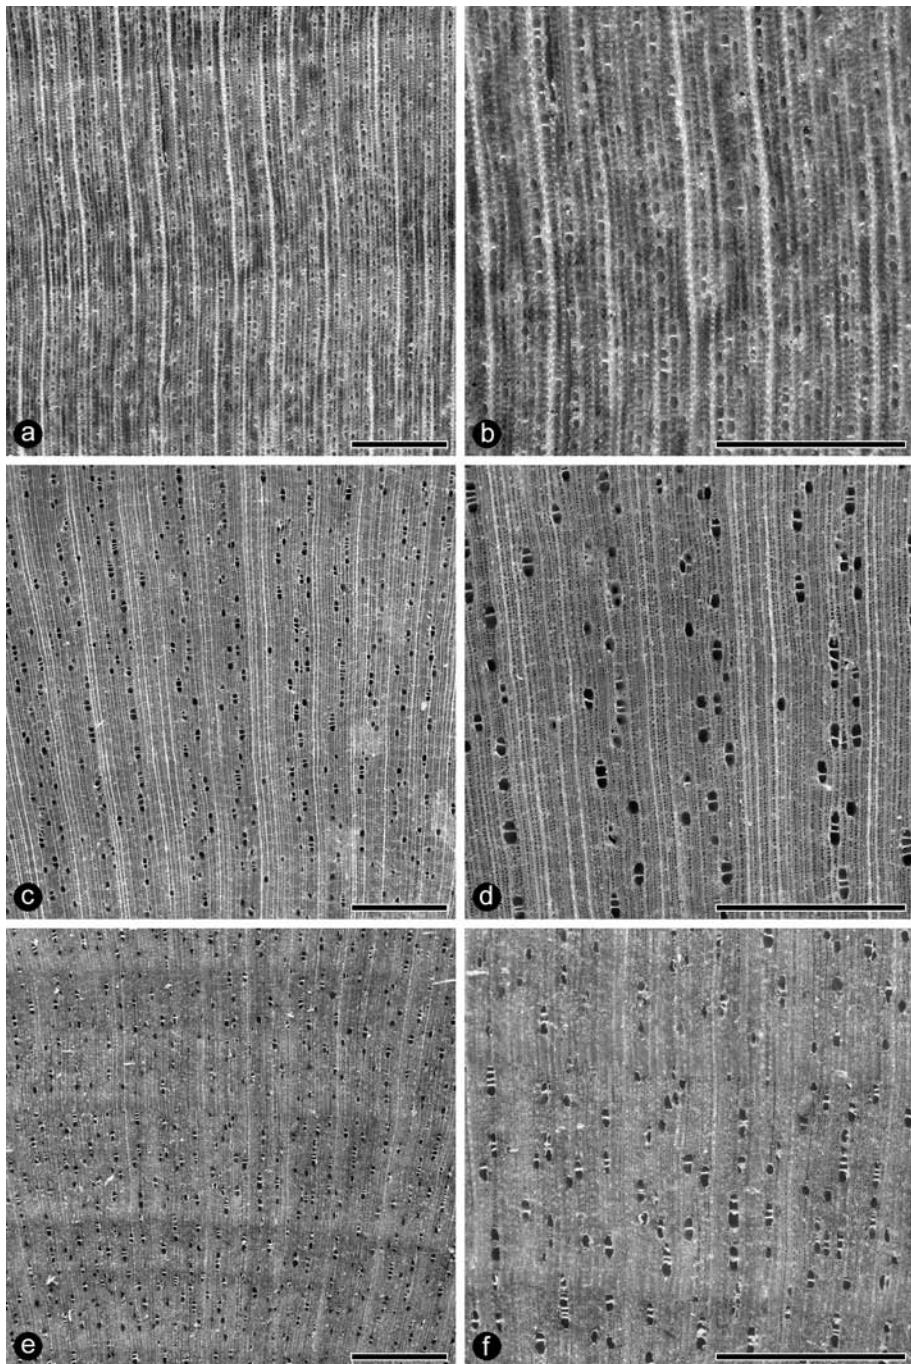

Fig. 3. a, b: *Actephila excelsa* var. *javanica* (Uw 10947). – c, d: *Actinostemon amazonicus* (Uw 19044). – e, f: *A. concolor* (Uw 6956). – Bar = 1 mm.

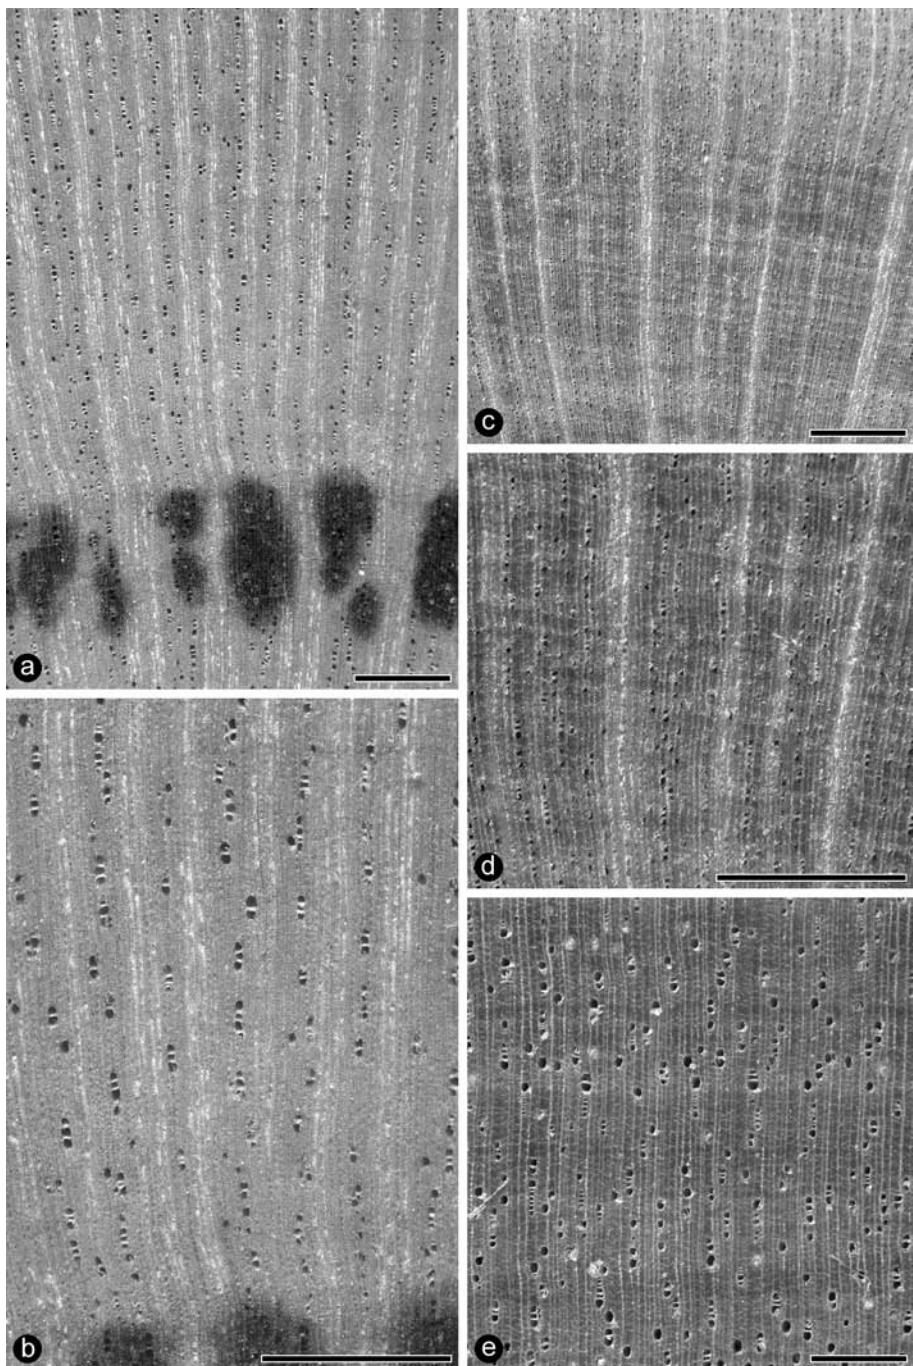

Fig. 4. a, b: *Actinostemon lundianus* (Uw 20024). – c, d: *A. schomburgkii* (Uw 10631). – e: *Adelia ricinella* (Uw 31986). – Bar = 1 mm.

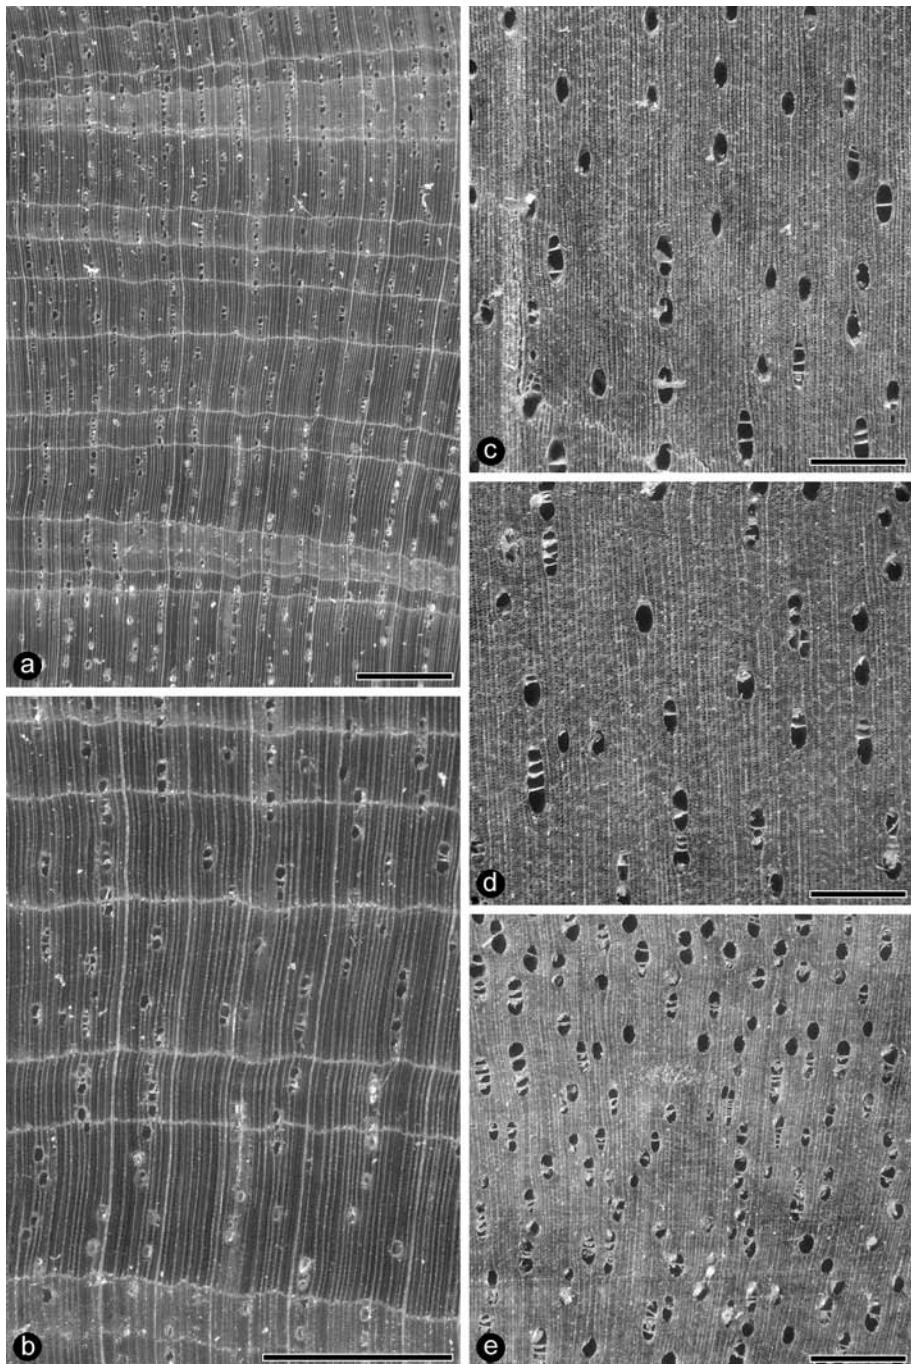

Fig. 5. a, b: *Agrostistachys borneensis* (Uw 21397). – c: *Alchornea brachygynne* (Uw 8035). – d: *A. cordata* (Uw 20676). – e: *A. cordifolia* (Uw 34214). – Bar = 1 mm.

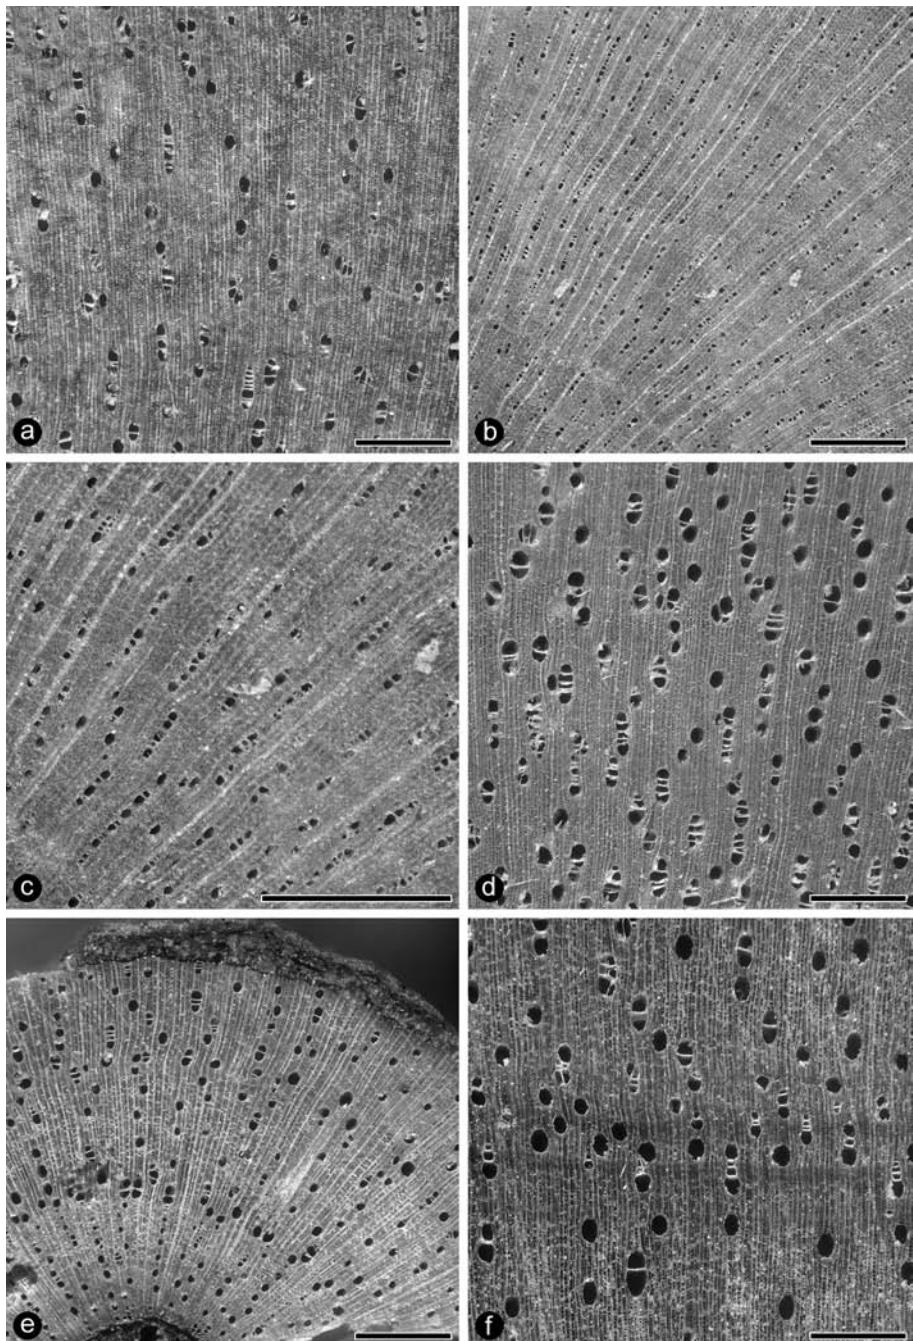

Fig. 6. a: *Alchornea grandis* (Uw 25667). – b, c: *A. ilicifolia* (Uw 31202). – d: *A. iricurana* (Uw 13083). – e: *A. schomburgkii* (Uw s.n. [Wessels Boer 1000]). – f: *A. triplinervia* var. *laevigata* (Uw 1425). – Bar = 1 mm.

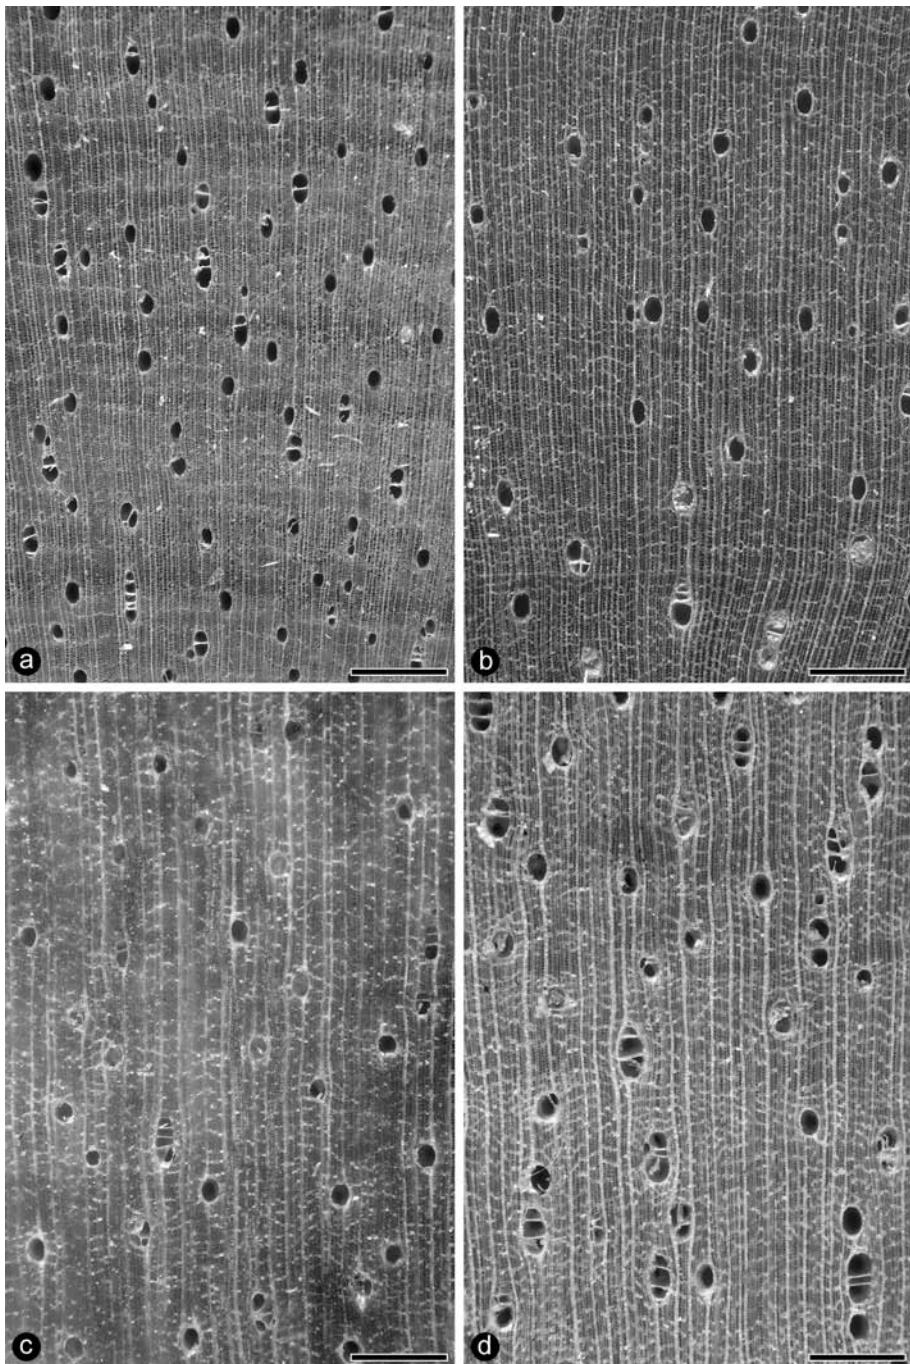

Fig. 7. a: *Alchorneopsis floribunda* (Uw 31188). – b: *A. trimera* (Uw 1443). – c: *Aleurites moluccana* (Uw 18261). – d: *A. moluccana* (Uw 24065). – Bar = 1 mm.

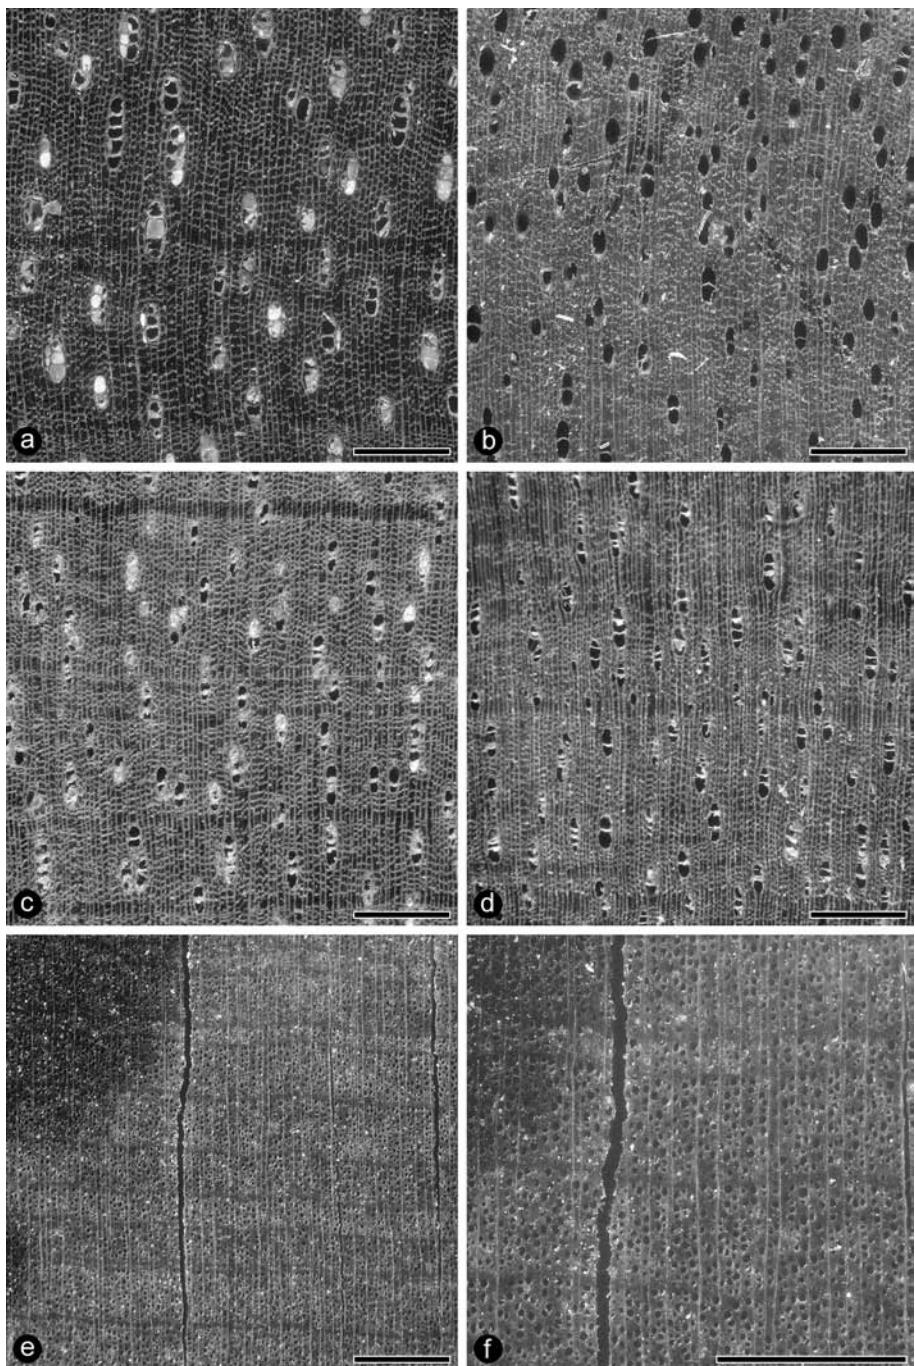

Fig. 8. a: *Amanoa caribaea* (Uw 27806).—b: *A. guianensis* (Uw 28).—c: *A. guianensis* (Uw 7670).—d: *A. oblongifolia* (Uw 8105).—e, f: *Androstachys johnsonii* (Uw 10909).—Bar = 1 mm.

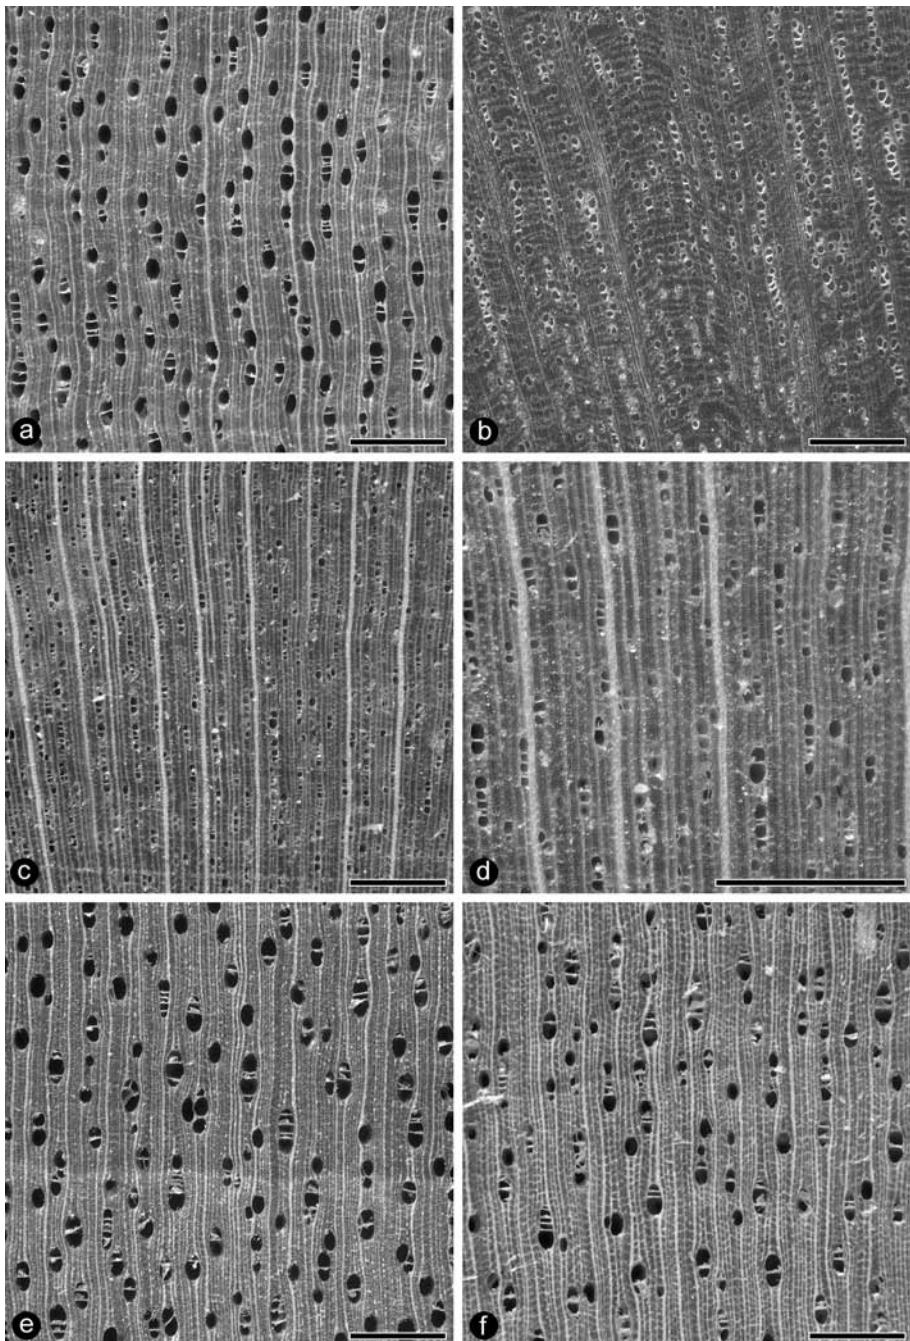

Fig. 9. a: *Anomalocalyx uleanus* (Uw 23807). – b: *Anthostema aubryananum* (Uw 29583). – c: *Antidesma ghesaembilla* (Uw 18048). – d: *A. membranaceum* (Uw 15897). – e, f: *A. montanum* (Uw 31312). – Bar = 1 mm.

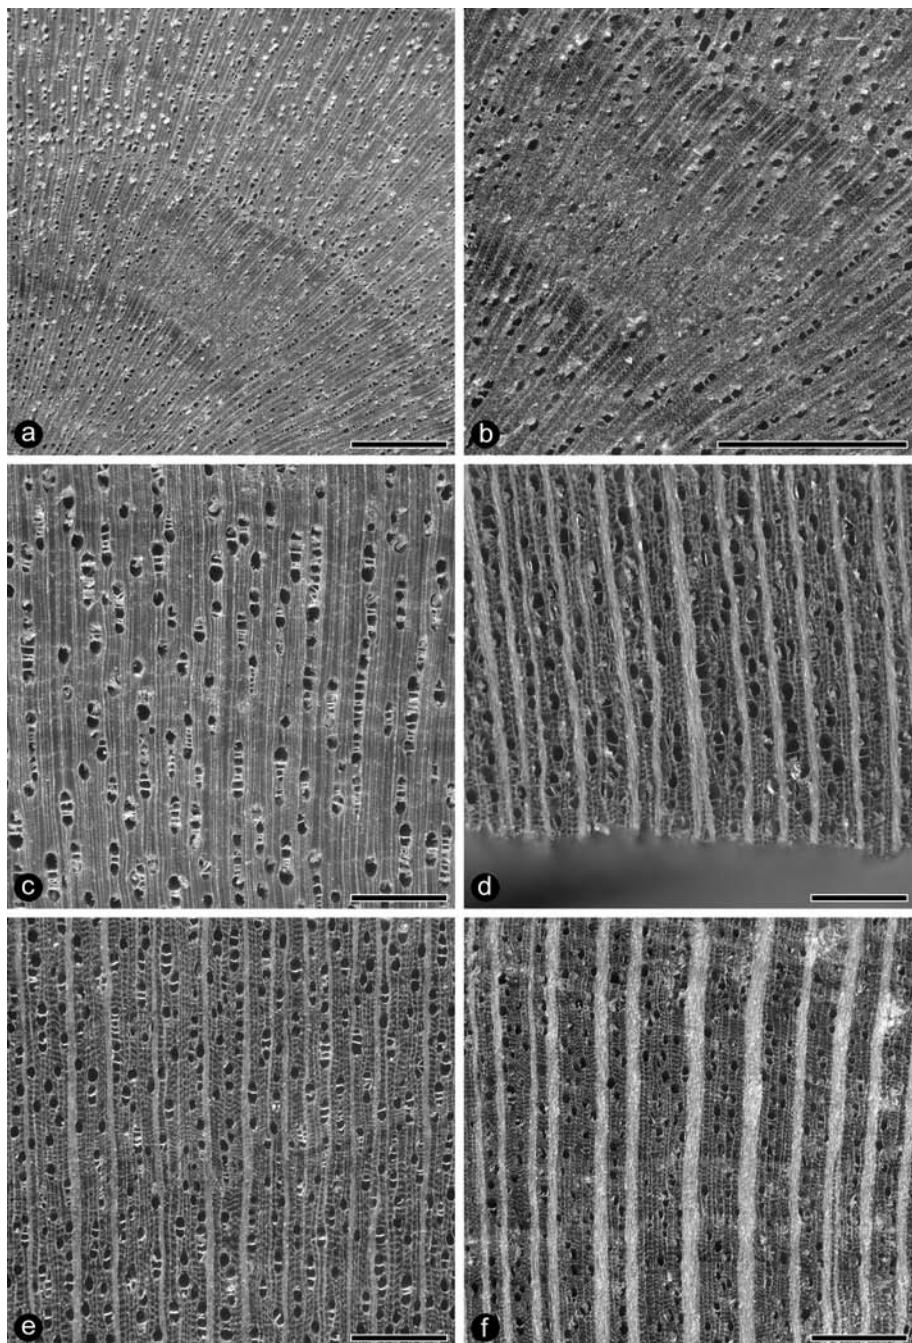

Fig. 10. a, b: *Antidesma pulvinatum* (Uw 31193). – c: *Aparisthium cordatum* (Uw 294). – d: *Aporosa arborea* (Uw 10897). – e: *A. octandra* var. *malesiana* (Uw 10898). – f: *A. symphloides* (Uw 21409). – Bar = 1 mm.

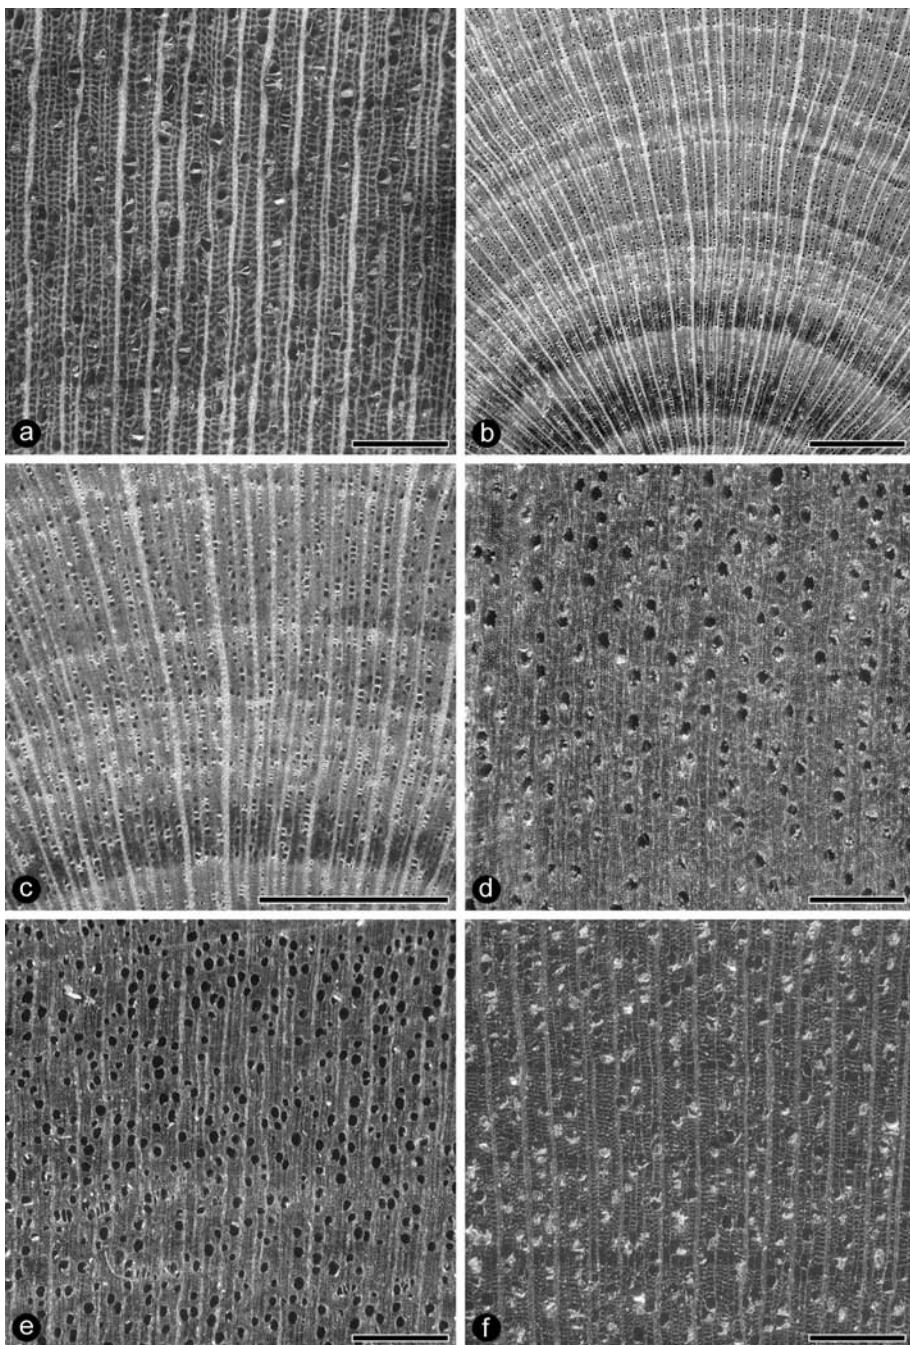

Fig. 11. a: *Ashtonina praeterita* (Uw 21410). – b, c: *Astrocasia neurocarpa* (Uw 30860). – d: *Austrobuxus nitidus* (Uw 21411). – e: A. sp. (Uw 31182). – f: *Baccaurea bracteata* (Uw 14608). – Bar = 1 mm.

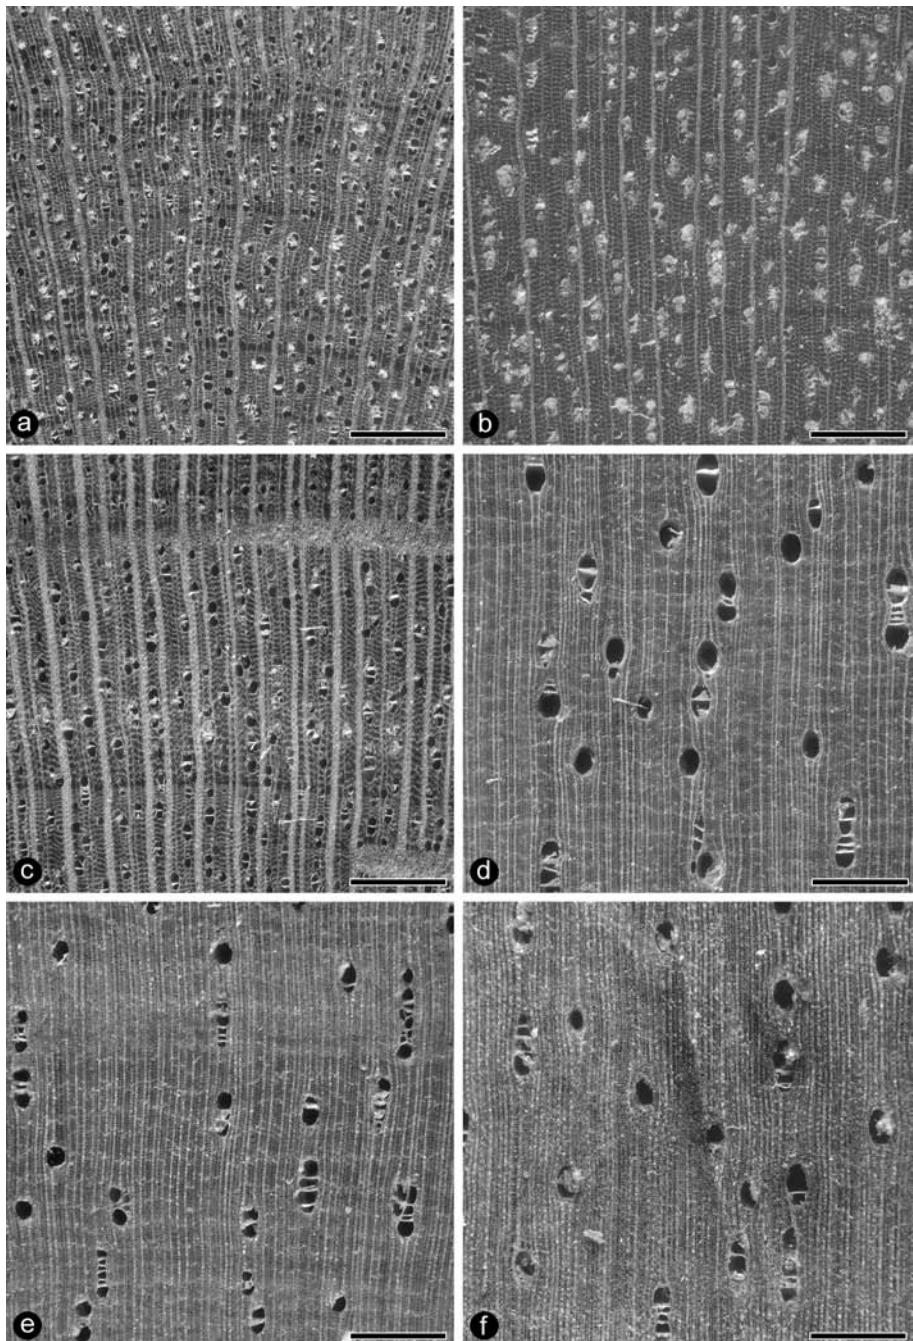

Fig. 12. a: *Baccaurea bracteata* (Uw 36893). – b: *B. philippinensis* (Uw 14613). – c: *B. ramiflora* (Uw 14614). – d: *Balakata baccata* (Uw 33123). – e: *B. luzonica* (Uw 10702). – f: *B. luzonica* (Uw 32734). – Bar = 1 mm.

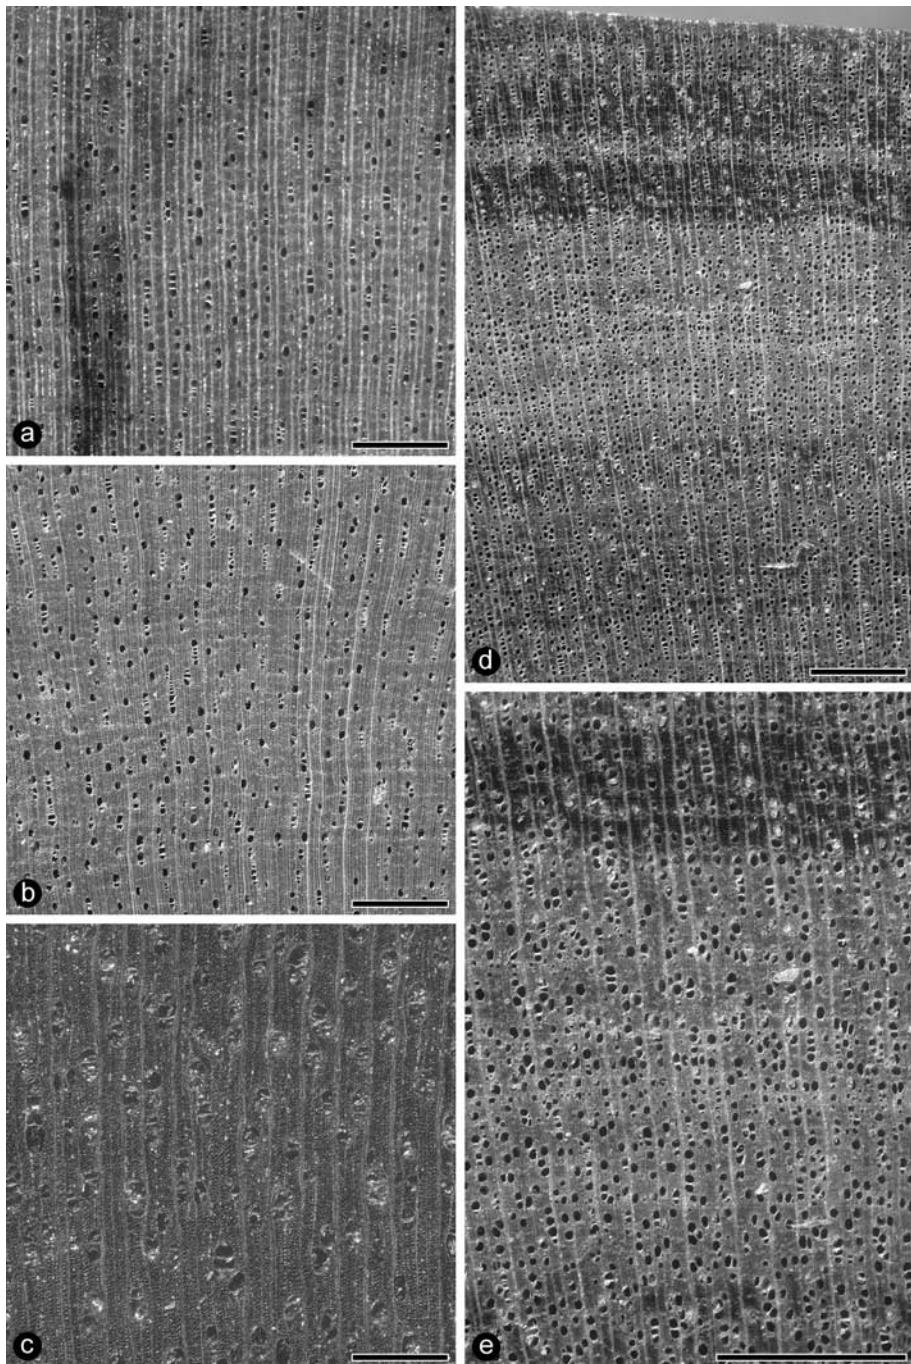

Fig. 13. a: *Baloghia inophylla* (Uw 24368). – b: *Bernardia tamanduana* (Uw 7477). – c: *Bischofia javanica* (Uw 21365). – d, e: *Blotia ankaranae* (Uw 11091). – Bar = 1 mm.

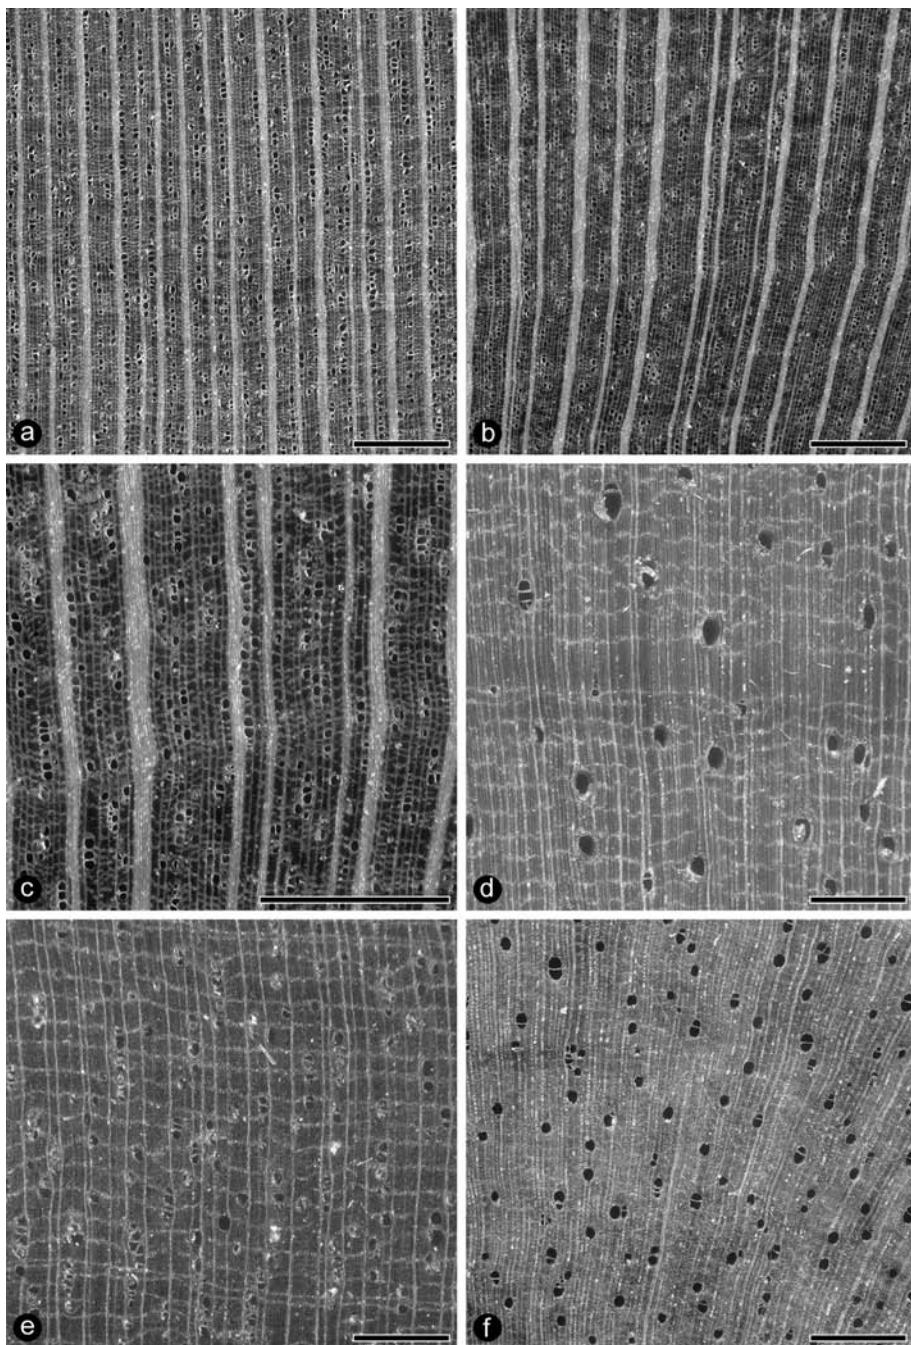

Fig. 14. a: *Blotia oblongifolia* (Uw 11090). – b, c: *B. oblongifolia* (Uw 11092). – d: *Blumeodendron kurzii* (Uw 31829). – e: *Borneodendron aenigmaticum* (Uw 22170). – f: *Botryophora geniculata* (Uw 36894). – Bar = 1 mm.

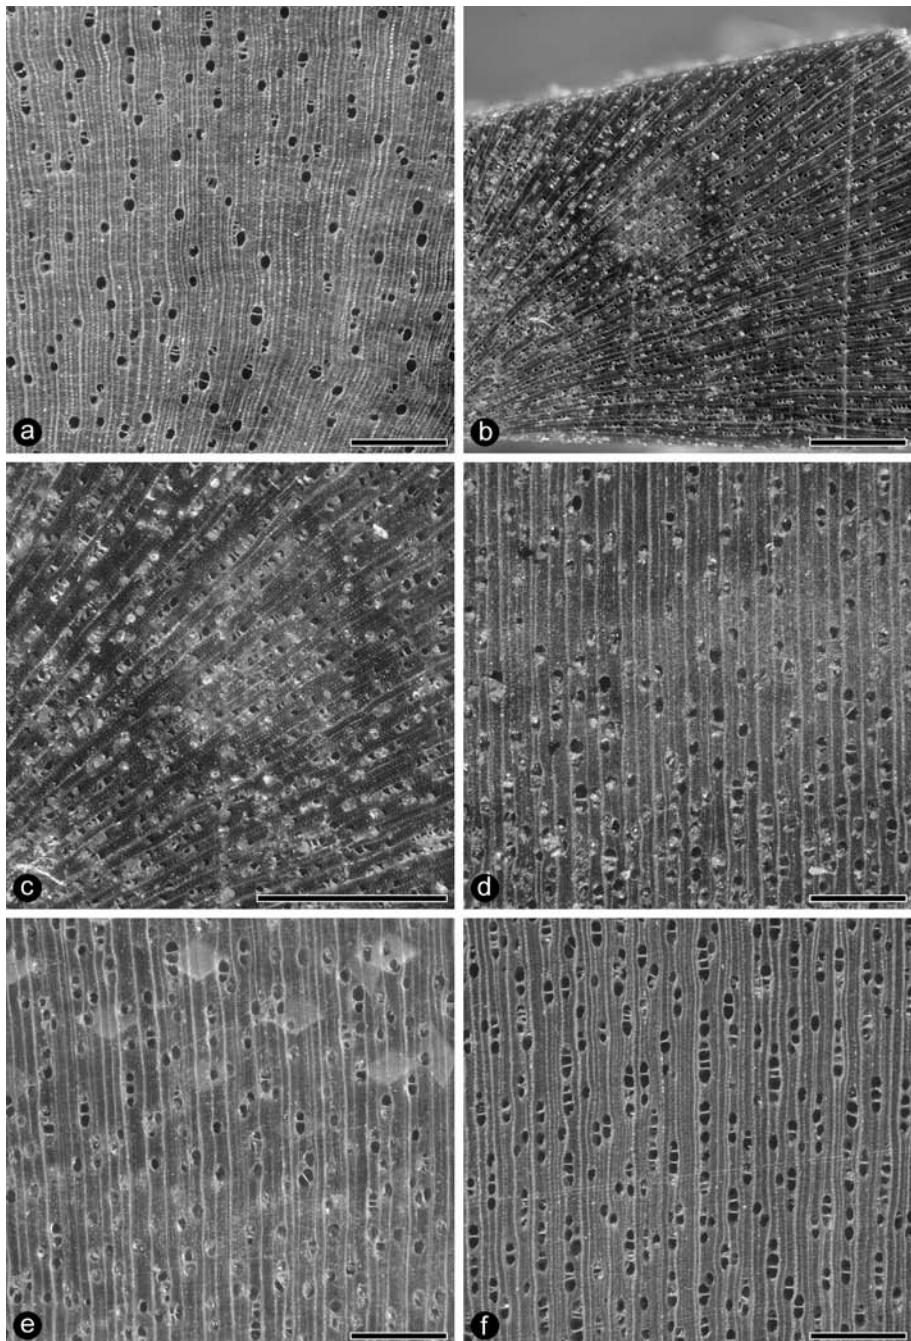

Fig. 15. a: *Botryophora geniculata* (Uw 36895). – b, c: *Breynia cernua* (Uw 14616). – d: *Bridelia penangiana* (Uw 10893). – e: *B. ripicola* (Uw 18770). – f: *B. tomentosa* (Uw 10899). – Bar = 1 mm.

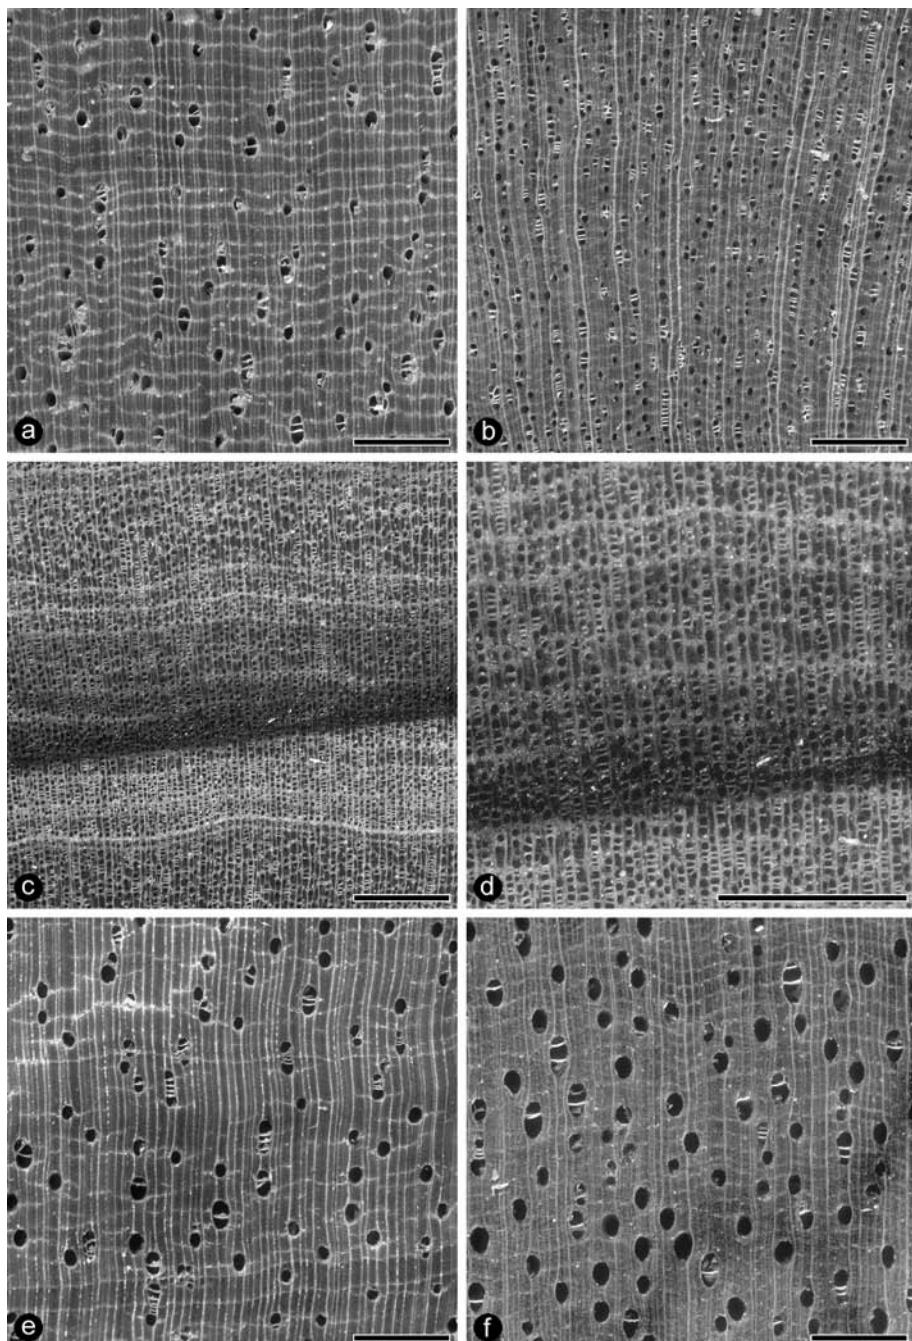

Fig. 16. a: *Caryodendron orinocense* (Uw 20026). – b: *Cavacoa quintasii* (Uw 22171). – c, d: *Celaenodendron mexicanum* (Uw 21735). – e: *Cephalomappa paludicola* (Uw 24370). – f: *Chaetocarpus castanocarpus* (Uw 22172). – Bar = 1 mm.

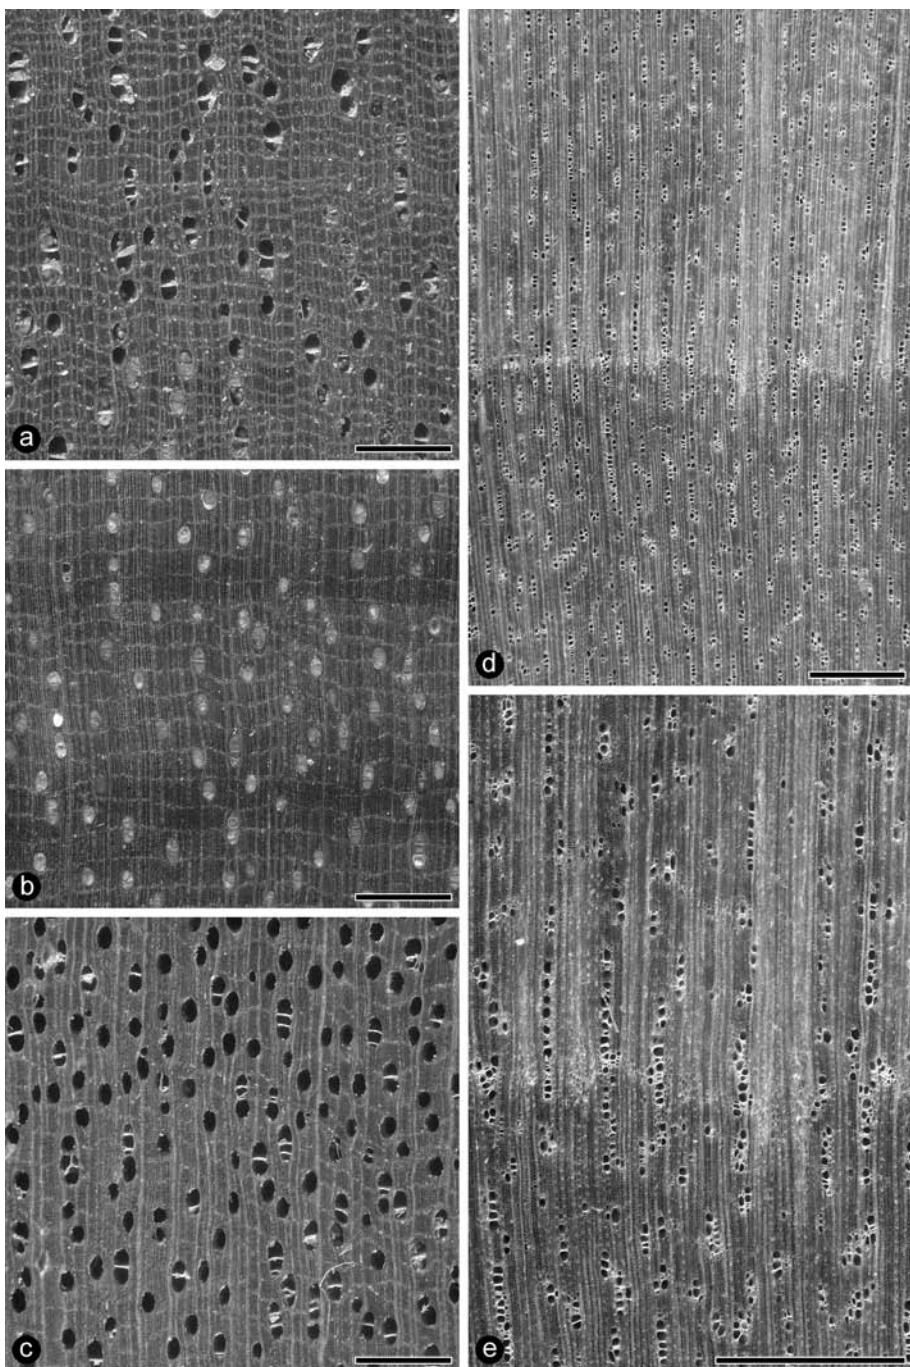

Fig. 17. a: *Chaetocarpus coriaceus* (Uw 24049). – b: *C. schomburgkianus* (Uw 153a). – c: *C. schomburgkianus* (Uw 12292). – d, e: *Chamaesyce articulata* (Uw 29658). – Bar = 1 mm.

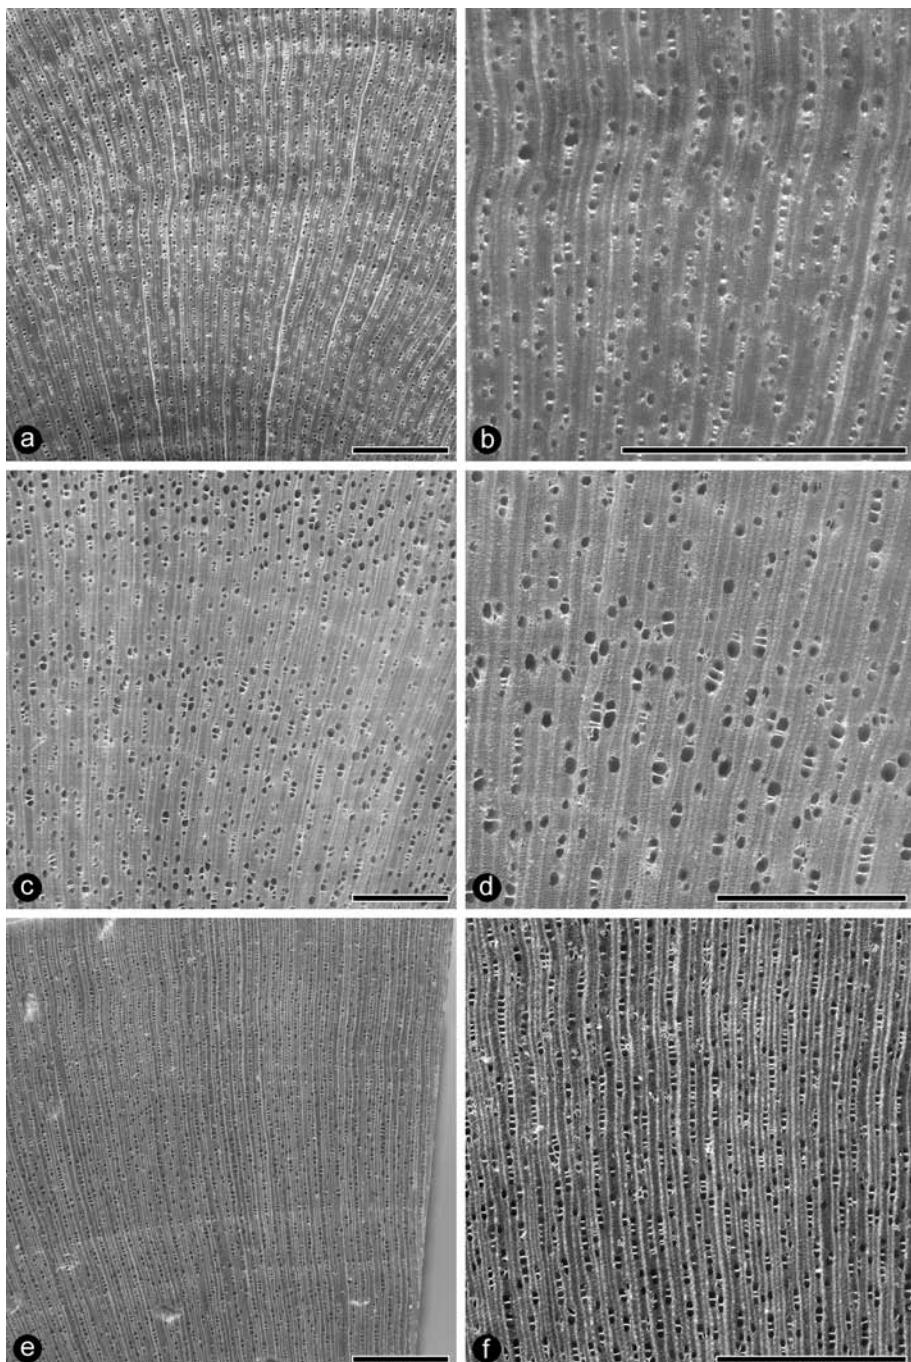

Fig. 18. a, b: *Chamaesyce celastroides* (Uw 18597). – c, d.: *C. halemanui* (Uw 34883). – e, f: *Chascotheca neopeltandra* (Uw 18707). – Bar = 1 mm.

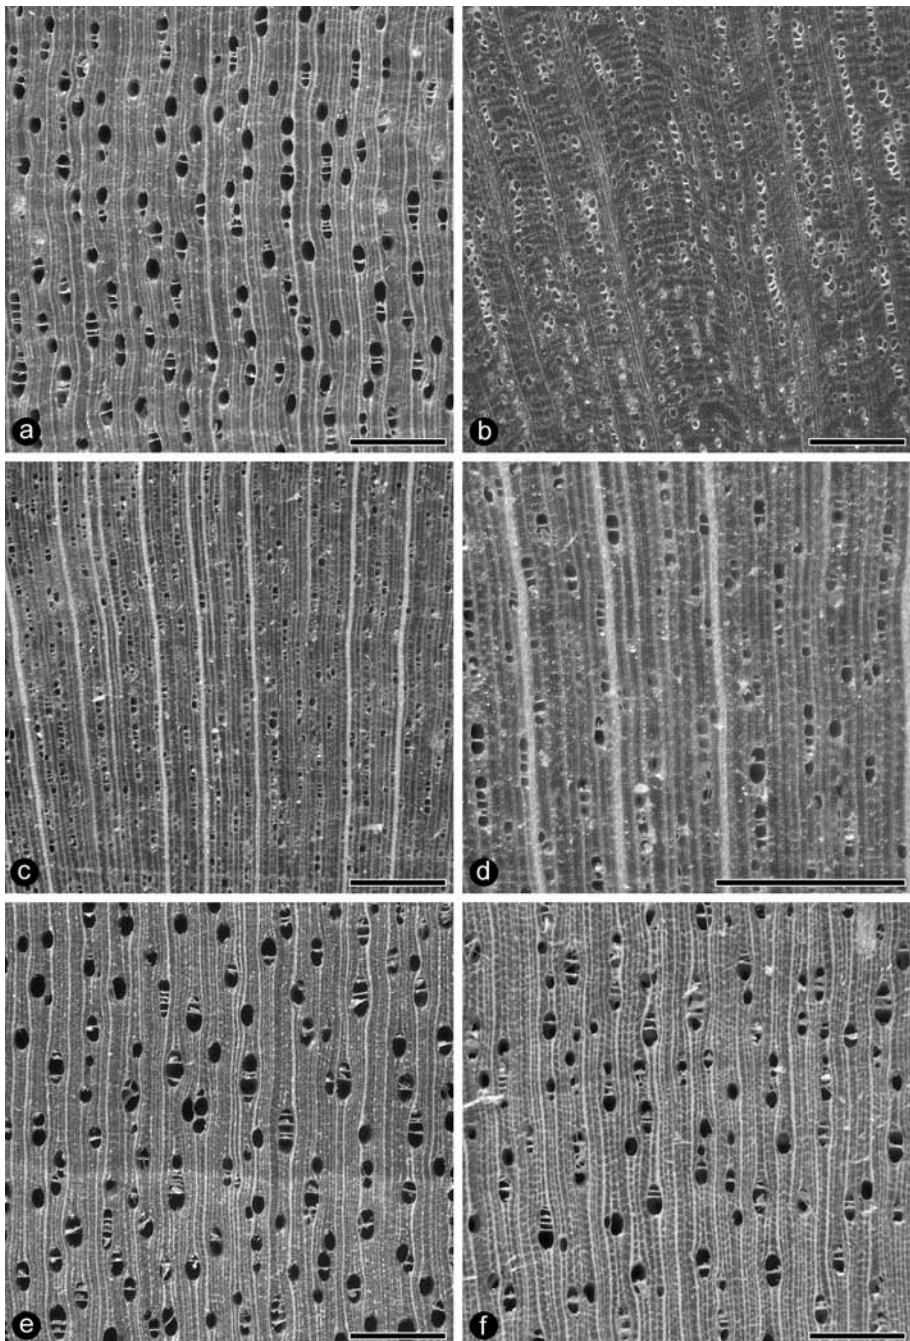

Fig. 19. a: *Cheilosia malayana* (Uw 21414). — b: *Choriceras tricorne* (Uw 36886). c, d: *Claoxylon sandwicense* (Uw 18559). — e: *Cleidion javanicum* (Uw 10792). — f: *C. javanicum* (Uw 21734). — Bar = 1 mm.

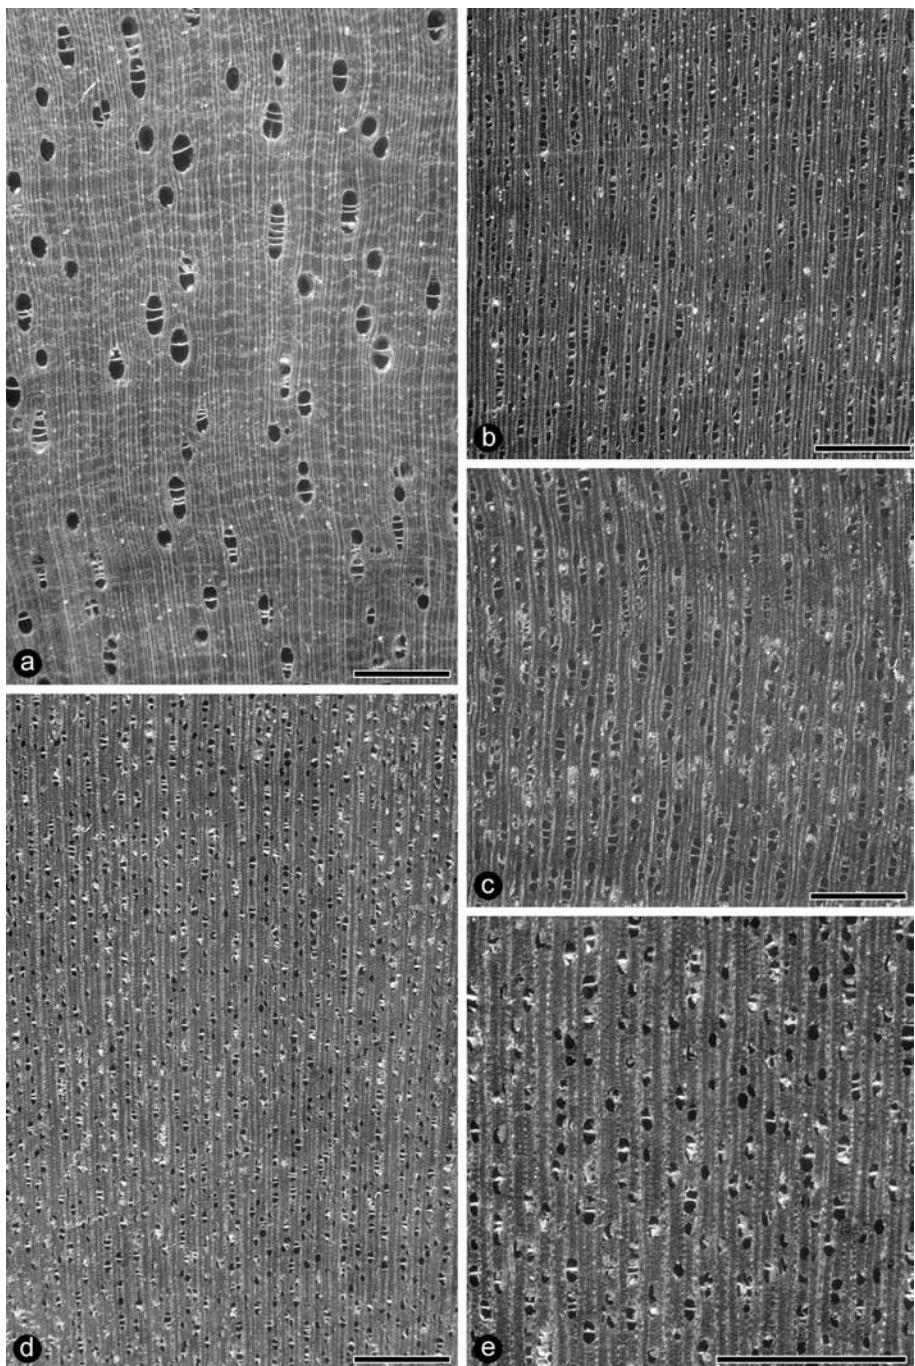

Fig. 20. a: *Cleidion praealtum* (Uw 7660). – b: *Cleistanthus collinus* (Uw 11053). – c: *C. collinus* (Uw 14619). – d, e: *C. laevis* (Uw 21377). – Bar = 1 mm.

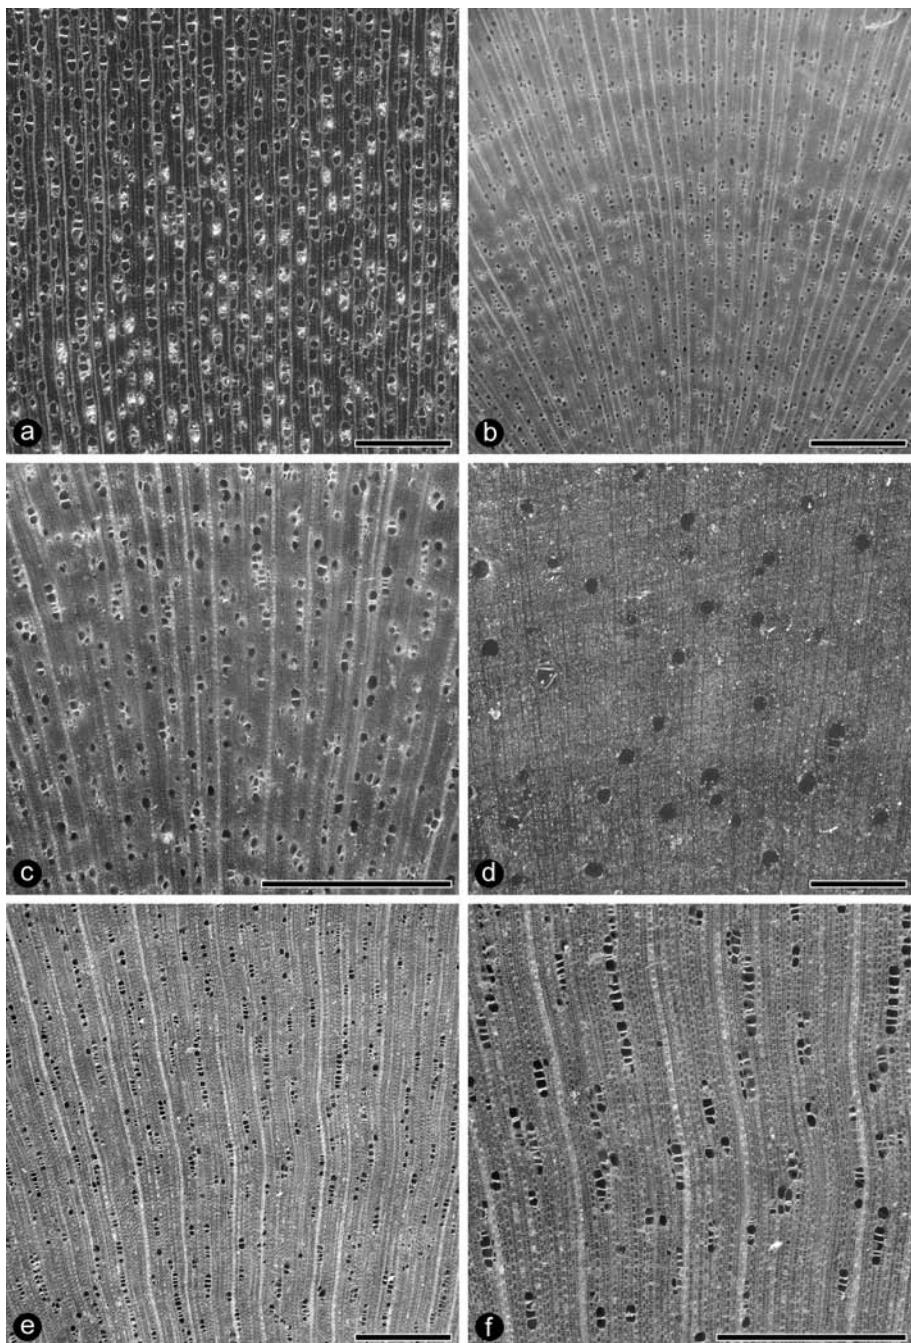

Fig. 21. a: *Cleistanthus papuanus* (Uw 10907). – b, c: *Clutia kilimandscharica* (Uw 25942). – d: *Cnidoscolus multilobus* (Uw 15965). – e, f: *Codiaeum variegatum* (Uw 24371). – Bar = 1 mm.

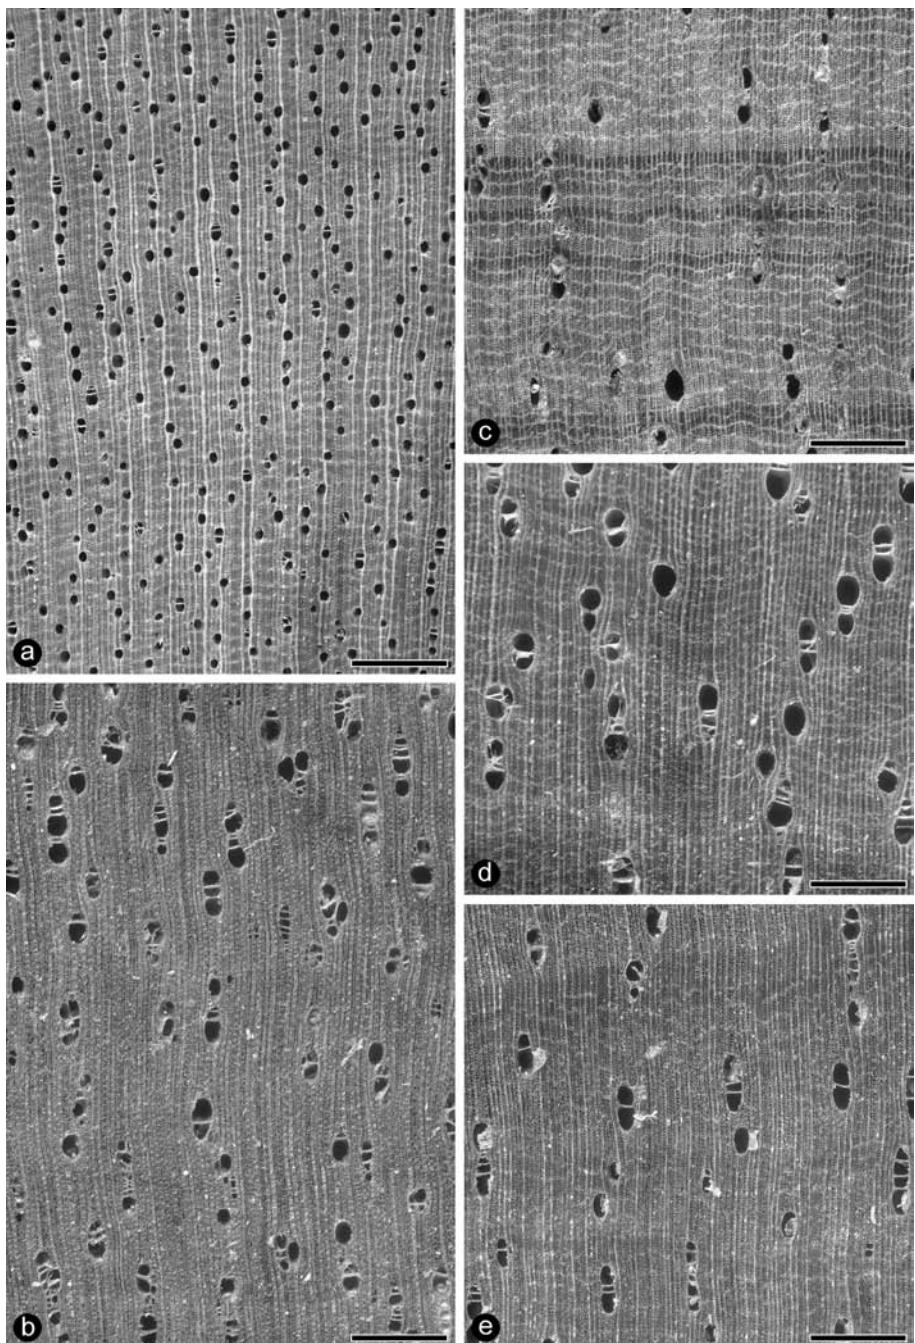

Fig. 22. a: *Koilodepas [Coelodepas] bantamensis* (Uw 21367). – b: *Colliguaja brasiliensis* (Uw 34885). – c: *Conceveiba guianensis* (Uw 60). – d: *C. hostmannii* (Uw 2197). – e: *C. krukoffii* (Uw 16190). – Bar = 1 mm.

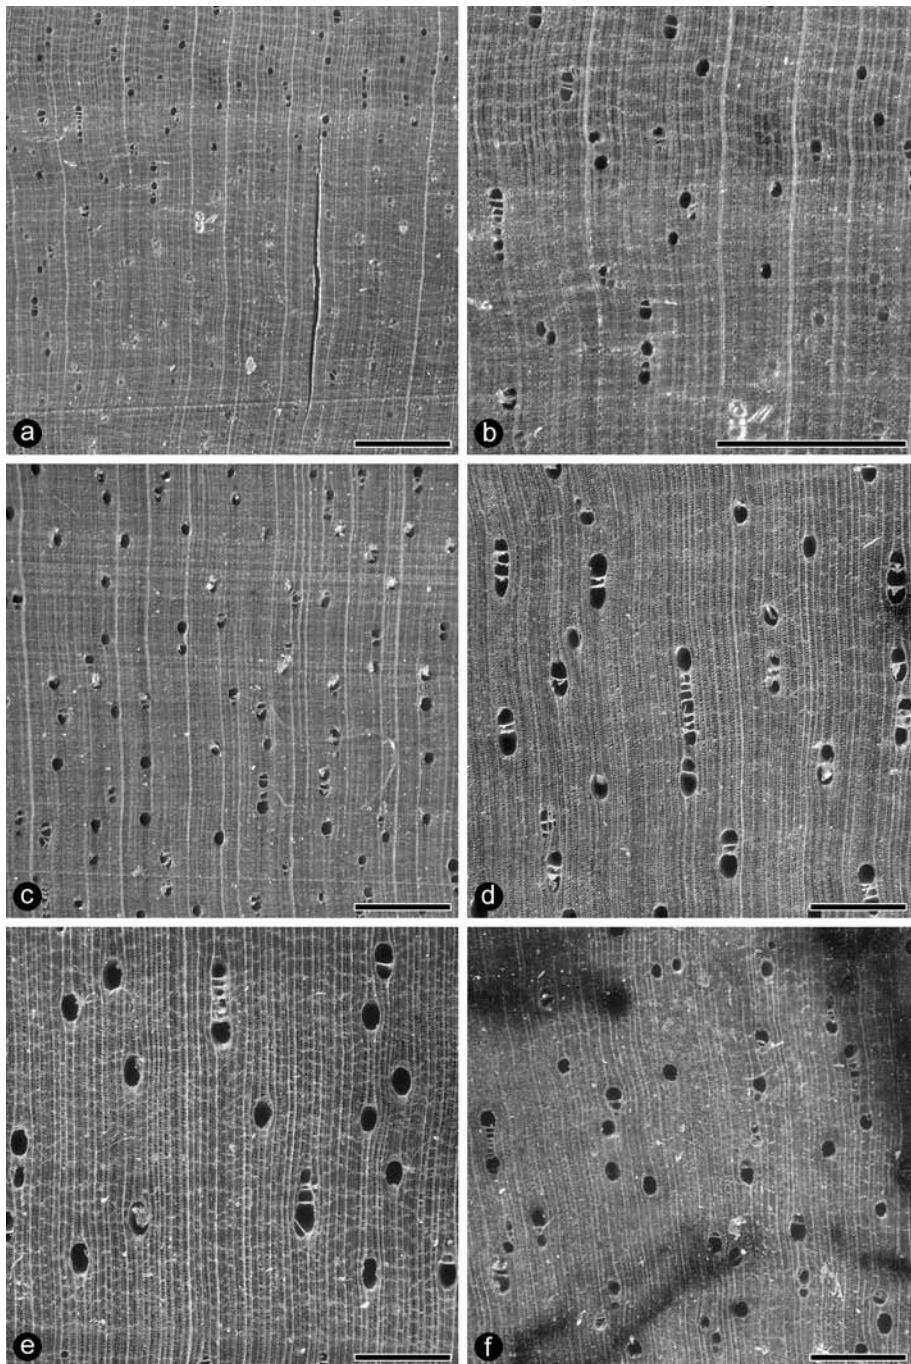

Fig. 23. a, b: *Conceveiba leptostachys* (Uw 34245). – c: *C. macrostachys* (Uw 34246). – d: *C. martiana* (Uw 7935). – e: *C. martiana* (Uw 25939). – f: *C. simulata* (Uw 7756). – Bar = 1 mm.

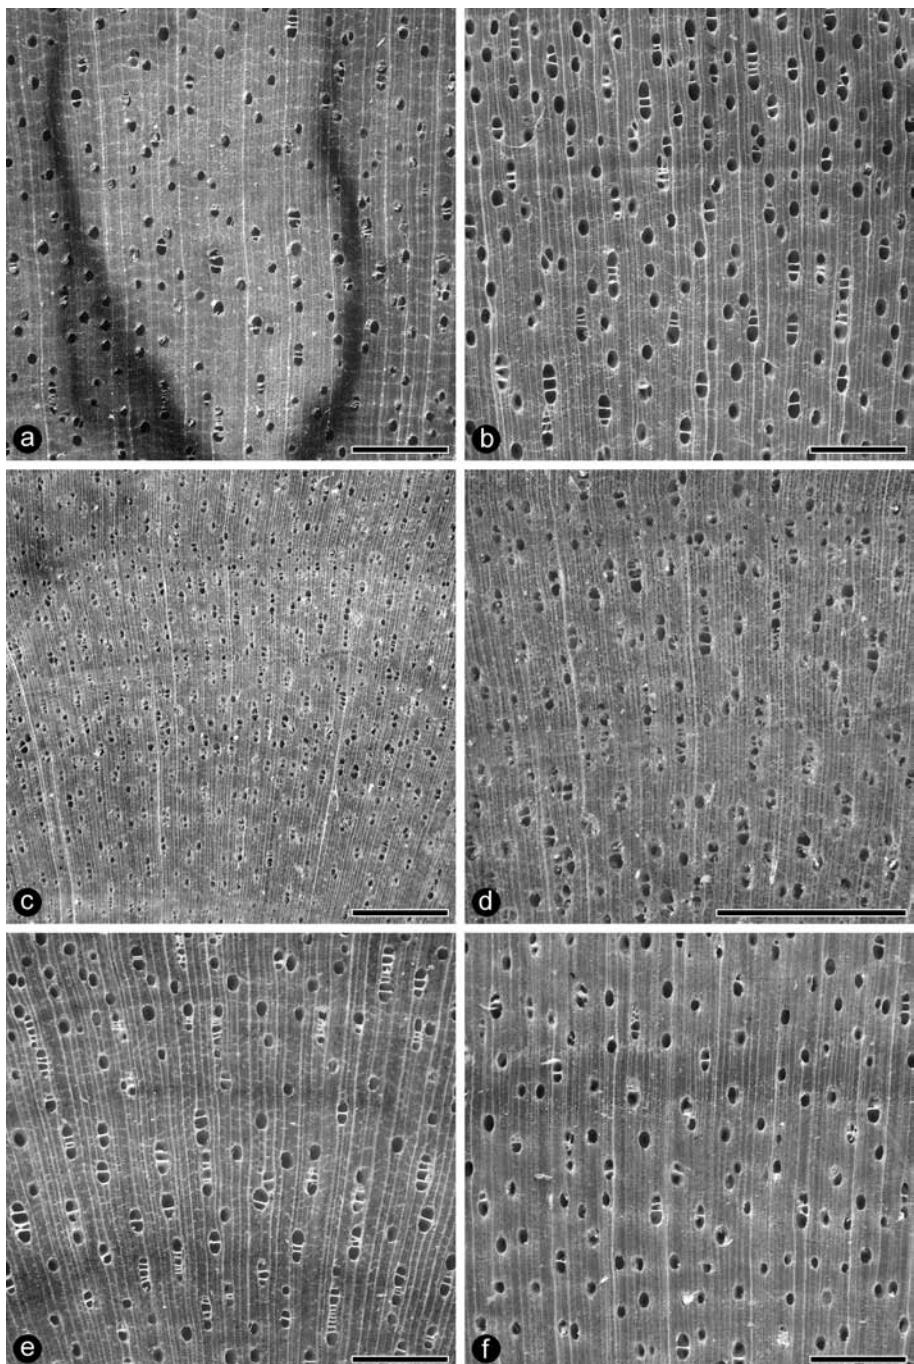

Fig. 24. a: *Croton argyratus* (Uw 24372).—b: *C. billbergianus* (Uw 7071).—c, d: *C. ceanothifolius* (Uw 14349).—e: *C. compressus* (Uw 13995).—f: *C. croizatii* (Uw 12206).—Bar = 1 mm.

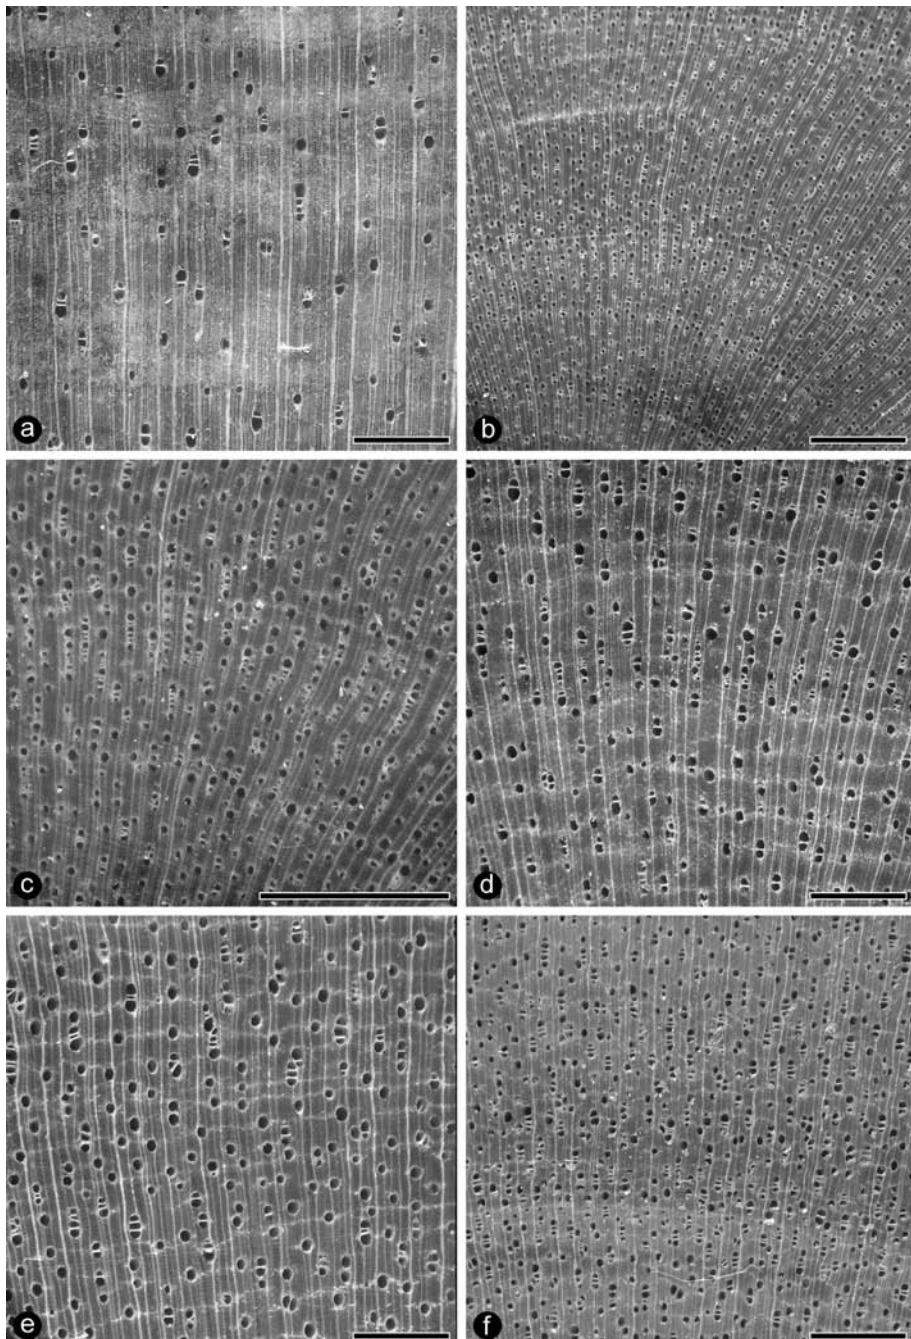

Fig. 25. a: *Croton cuneatus* (Uw 16232). – b, c: *C. flavens* var. *balsamifer* (Uw 15386). – d: *C. funckianus* (Uw 25354). – e: *C. gossypifolius* (Uw 11009). – f: *C. gratissimus* (Uw 24542). – Bar = 1 mm.

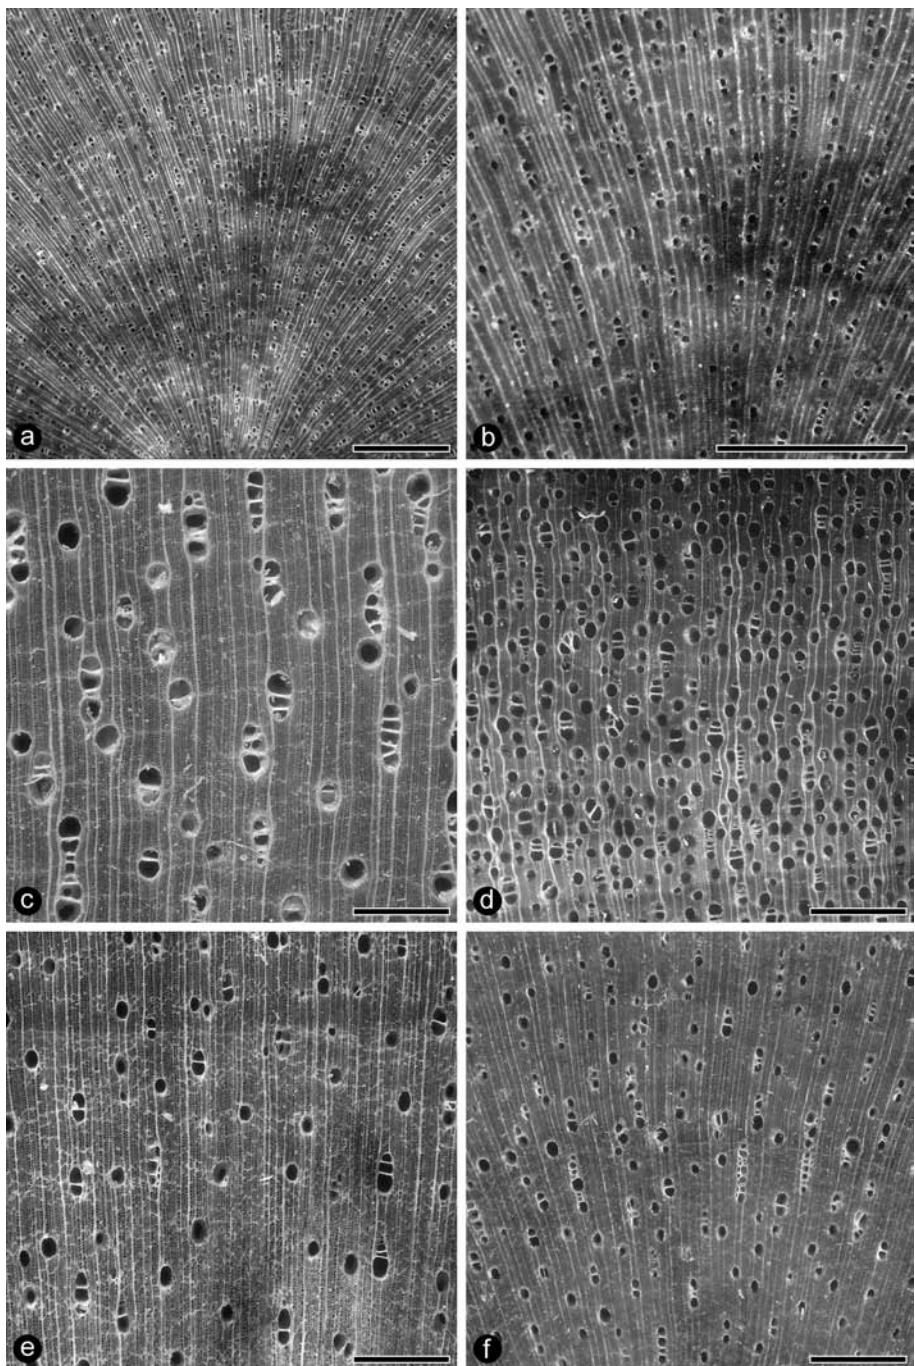

Fig. 26. a, b: *Croton linearis* (Uw 20279). – c: *C. matourensis* (Uw 631). – d: *C. mubango* (Uw 15616). – e: *C. palanostigma* (Uw 16204). – f: *C. tafelbergicus* (Uw 2478). – Bar = 1 mm.

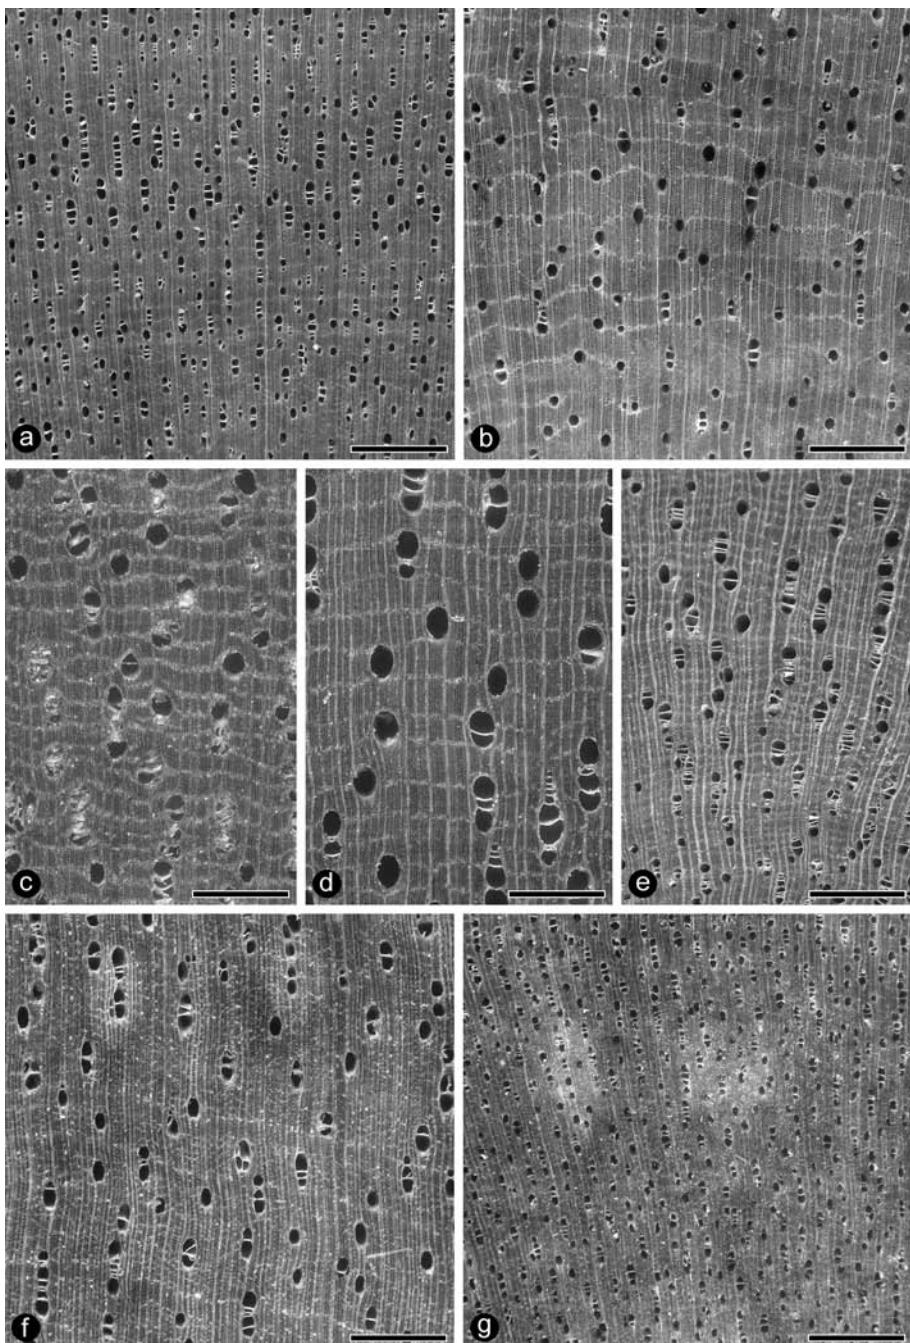

Fig. 27. a: *Croton triacros* (Uw 24373). – b: *C. urucuranus* (Uw 14331). – c: *Cunuria spruceana* (Uw 2481). – d: *C. spruceana* (Uw 8234). – e: *C. spruceana* (Uw 21083). – f: *Cyrtogonone argentea* (Uw 25948). – g: *Dendrothrix yutajensis* (Uw 32720). – Bar = 1 mm.

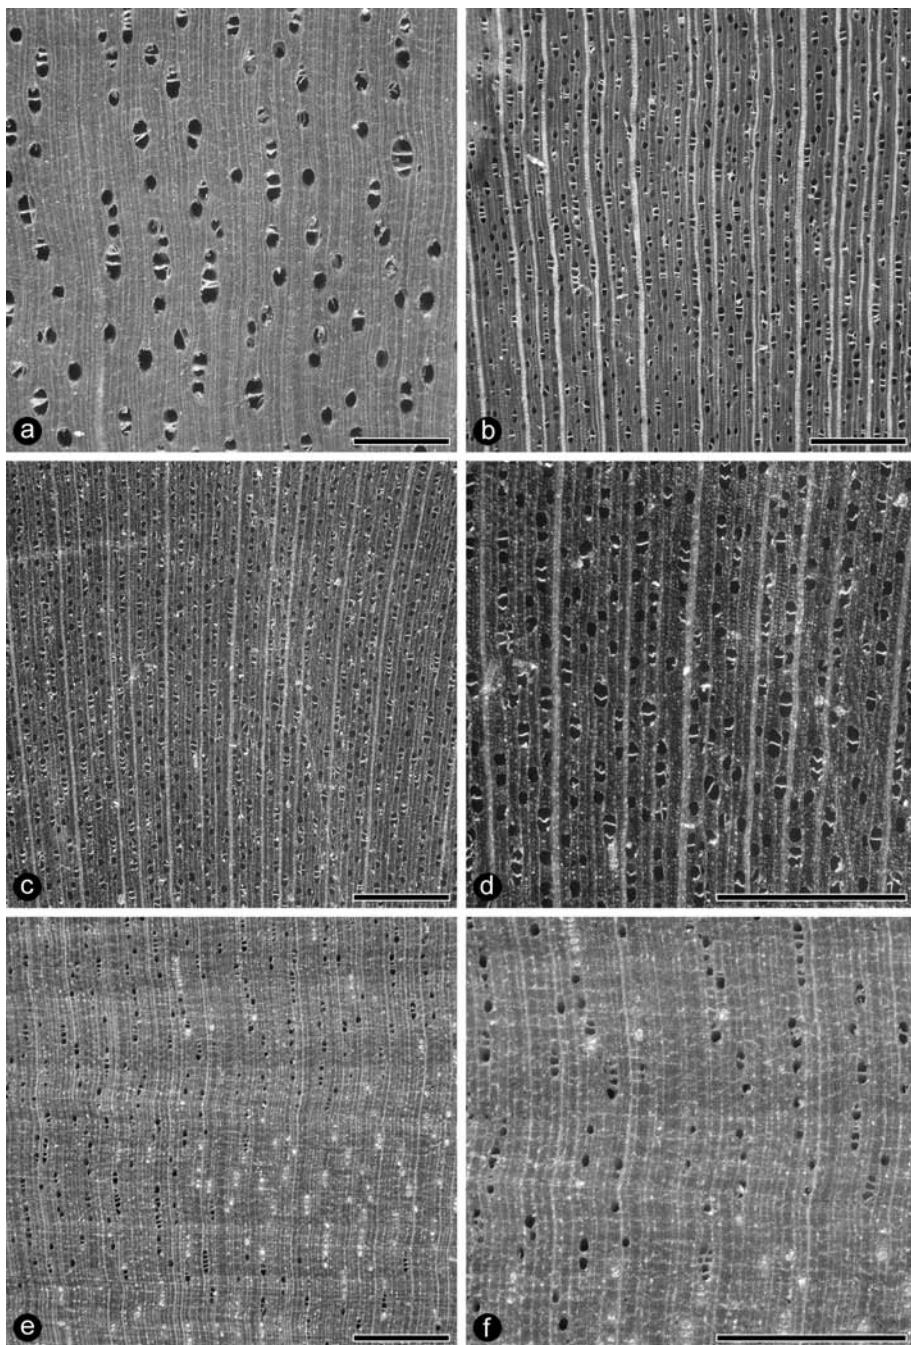

Fig. 28. a: *Dichostemma glaucescens* (Uw 22174). – b: *Dicoelia beccariana* (Uw 21376). – c, d: *Didymocistus chrysadenius* (Uw 7787). – e, f: *Dimorphocalyx malayana* (Uw 21398). – Bar = 1 mm.

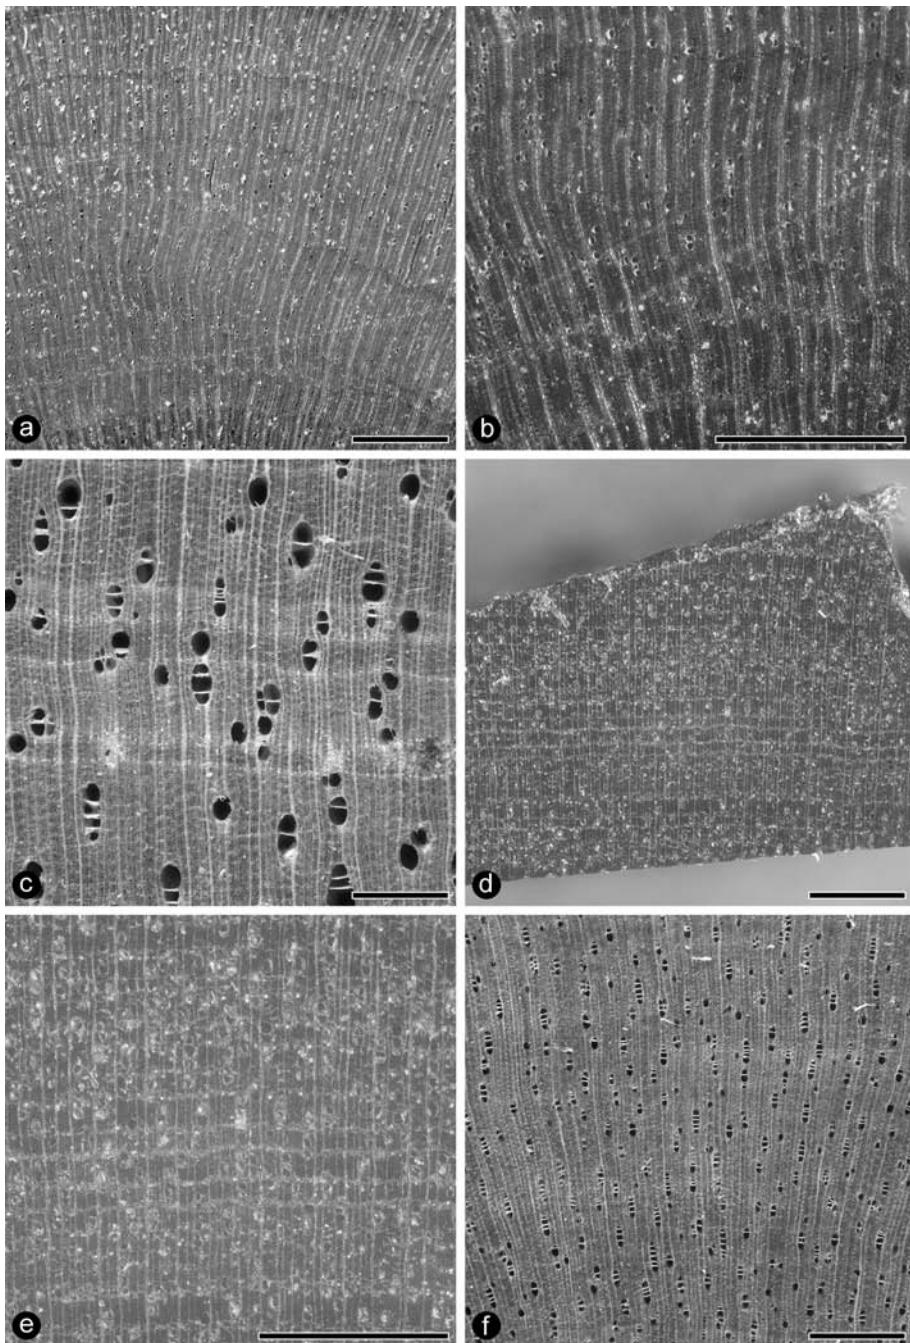

Fig. 29. a, b: *Discocarpus essequiboensis* (Uw 32504). – c: *Discoglypremma caloneura* (Uw 9318). – d, e: *Dissiliaria baloghoides* (Uw 14625). – f: *Ditta myricoides* (Uw 25715). – Bar = 1 mm.

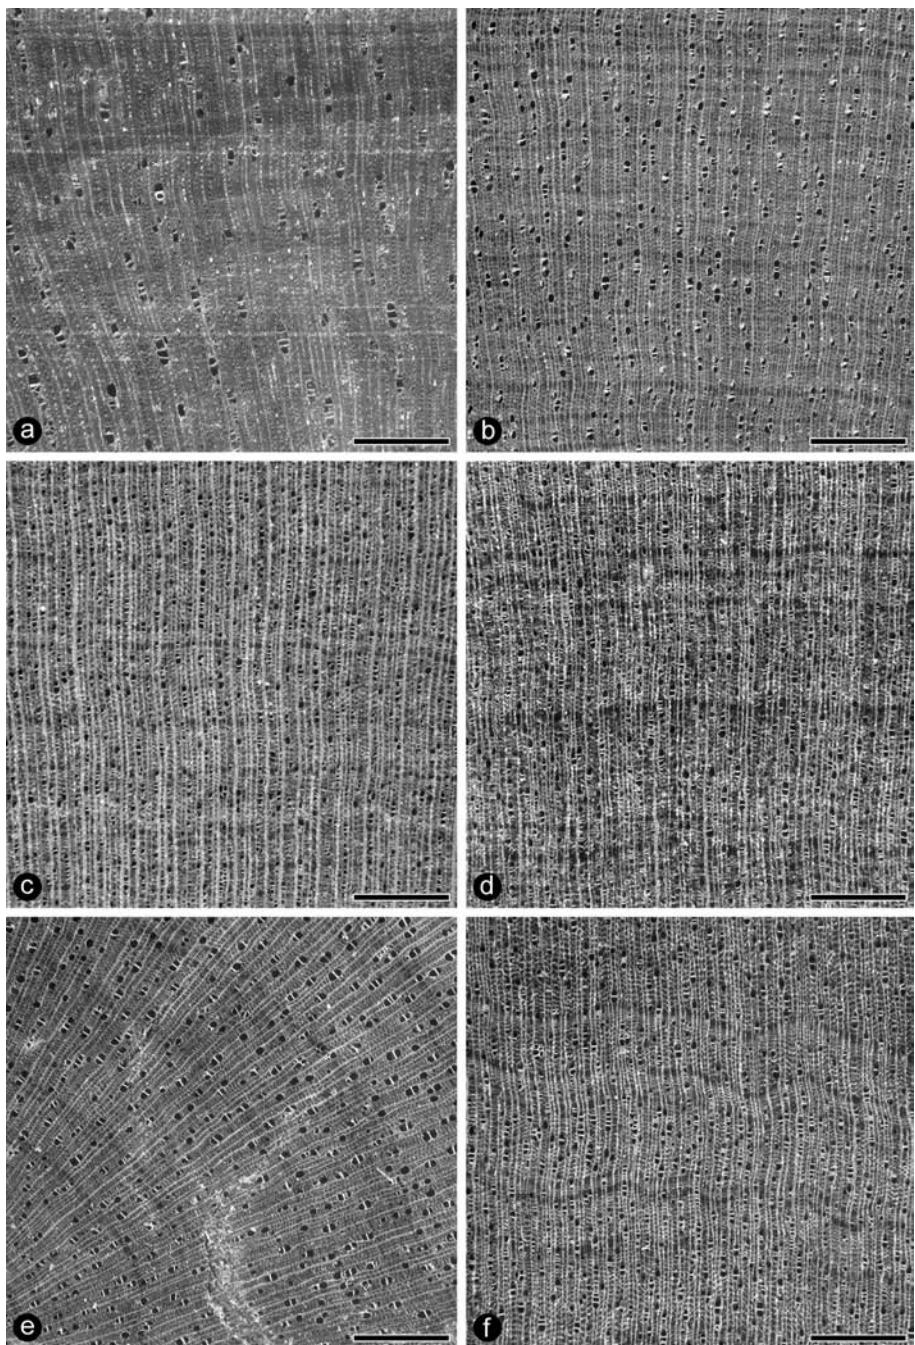

Fig. 30. a: *Dodecastigma integrifolium* (Uw 873). – b: *Drypetes amazonica* (Uw 7558). – c: *D. crocea* (Uw 10449). – d: *D. diversifolia* (Uw 6263). – e: *D. floribunda* (Uw 9288). – f: *D. globosa* (Uw 10900). – Bar = 1 mm.

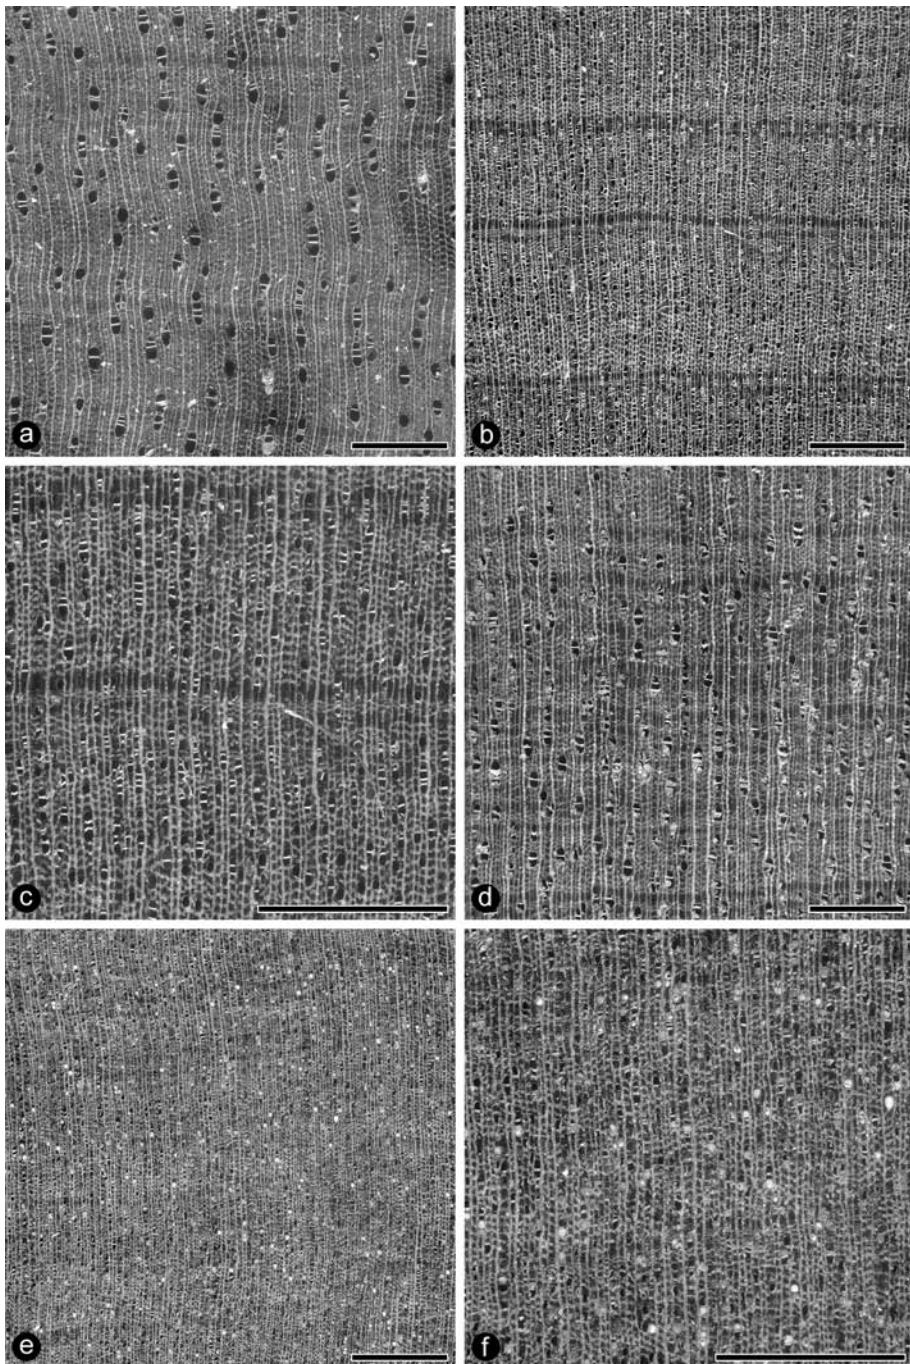

Fig. 31. a: *Drypetes longifolia* (Uw 10901). – b, c: *D. ovalis* (Uw 11366). – d: *D. principium* (Uw 10912). – e, f: *D. sepiaria* (Uw 14631). – Bar = 1 mm.

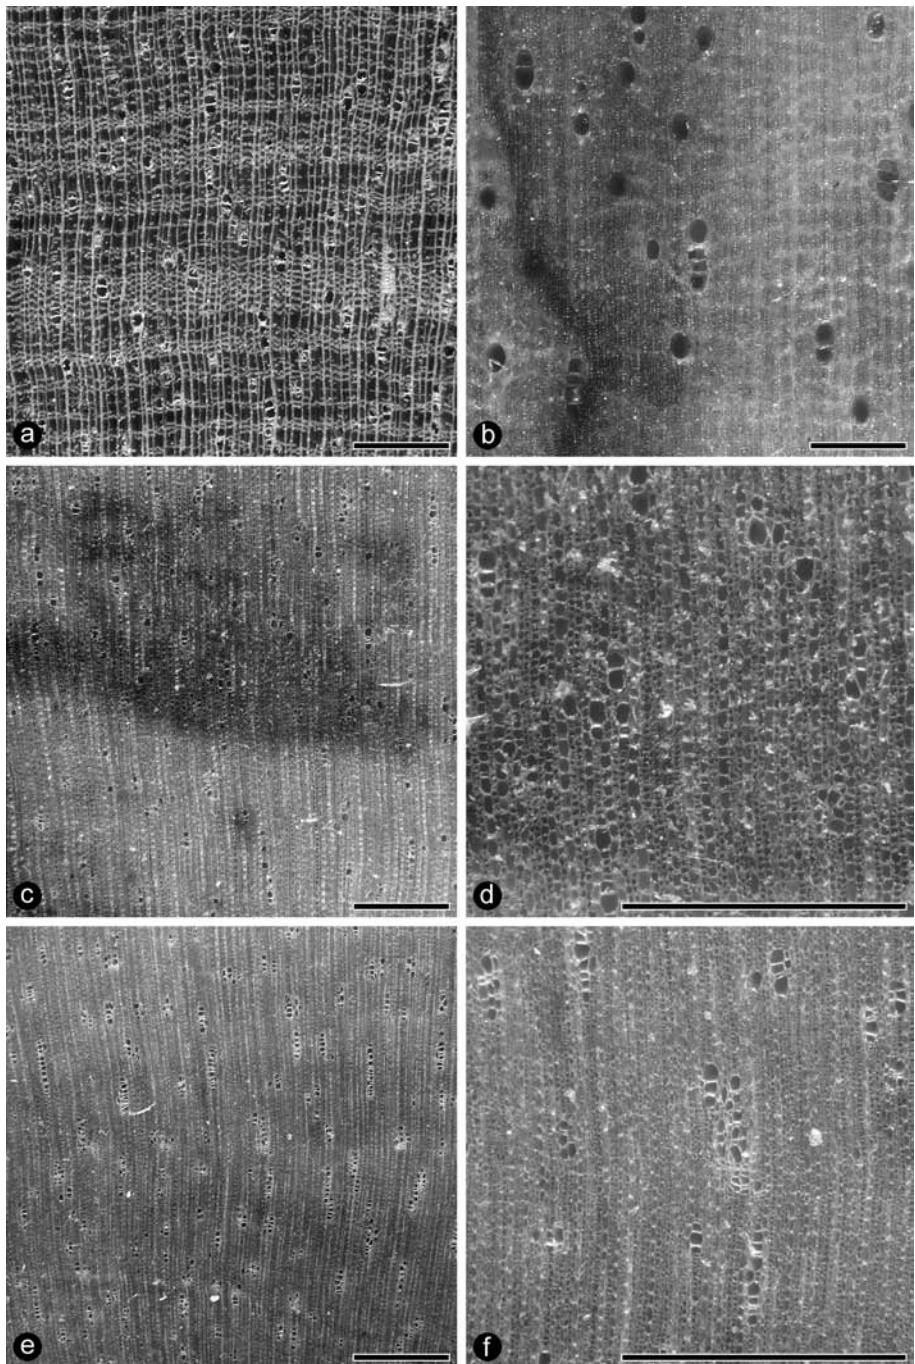

Fig. 32. a: *Drypetes variabilis* (Uw 1097). – b: *Endospermum moluccanum* (Uw 18114). – c,d: *Euphorbia calycina* (Uw 22175). – e, f: *E. dendroides* (Uw 9235). – Bar = 1 mm.

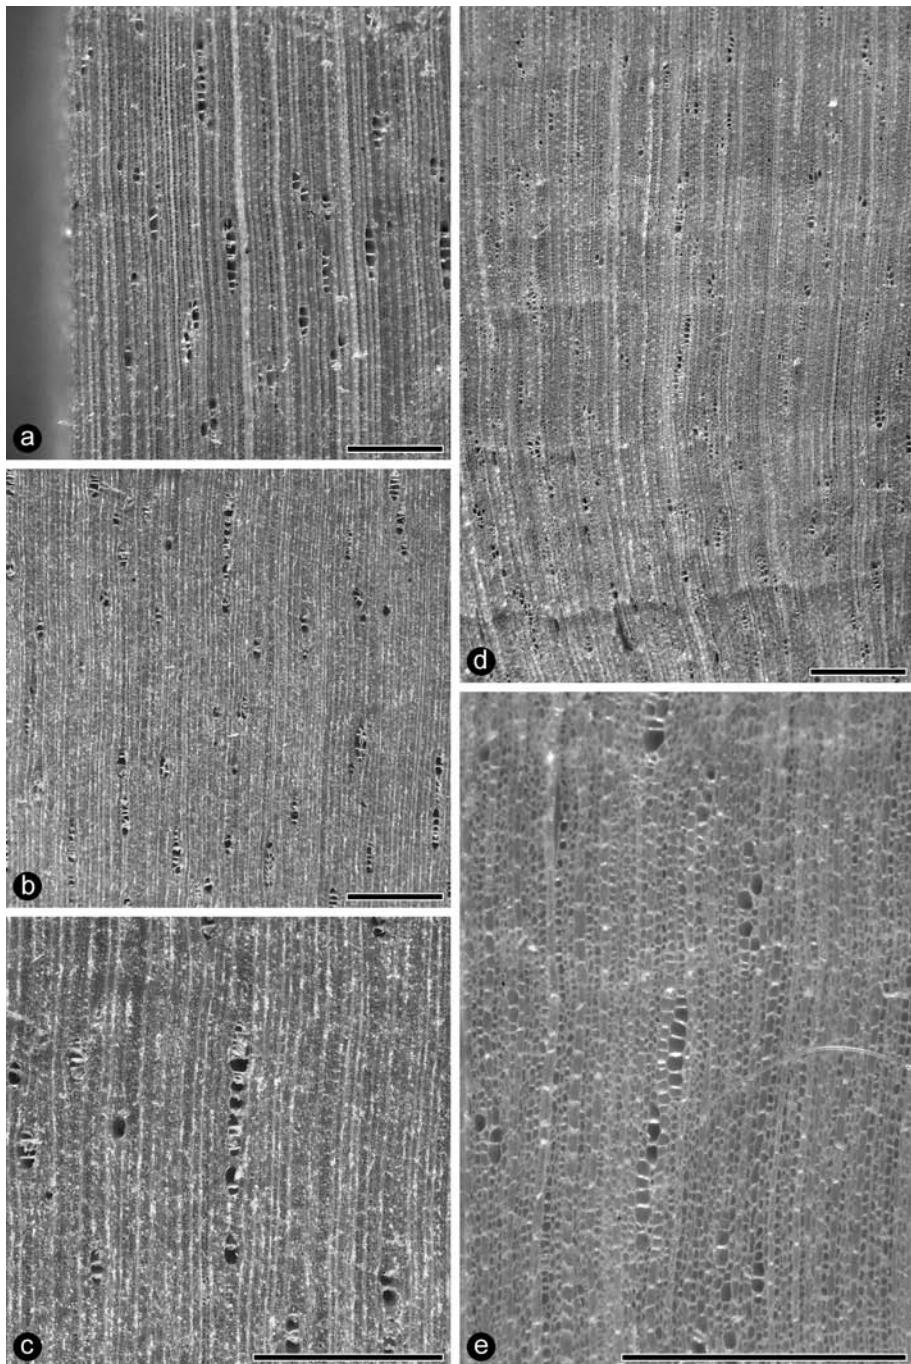

Fig. 33. a: *Euphorbia ingens* (Uw 22013). – b, c: *E. oncoclada* (Uw 33127). – d, e: *E. poissoni* (Uw 25946). – Bar = 1 mm.

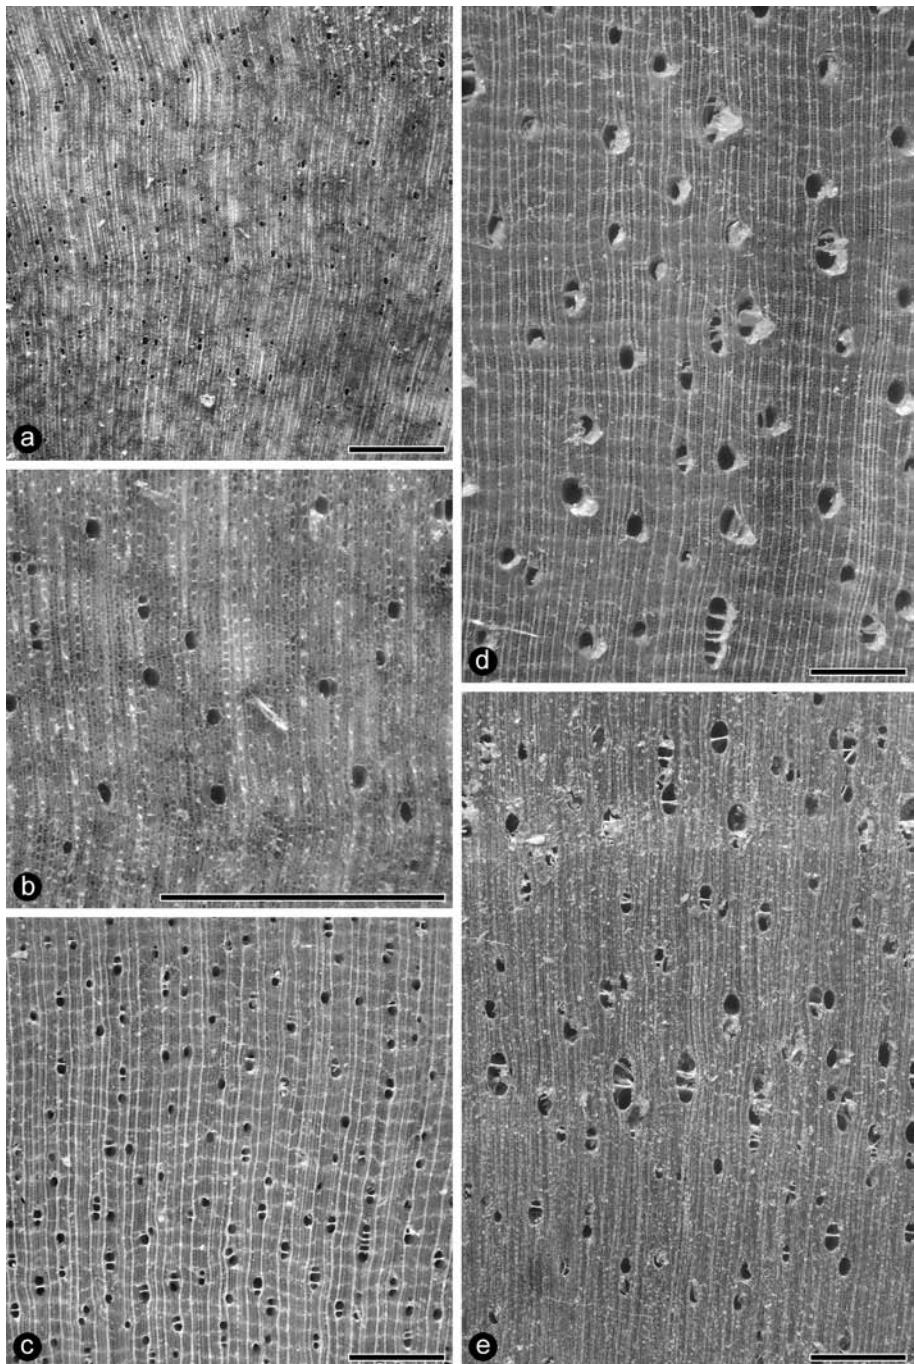

Fig. 34. a, b: *Euphorbia tirucalli* (Uw 24543). – c: *Excoecaria agallocha* (Uw 10704). – d: *E. myrioneura* (Uw 29104). – e: *Falconeria insignis* (Uw 32726). – Bar = 1 mm.

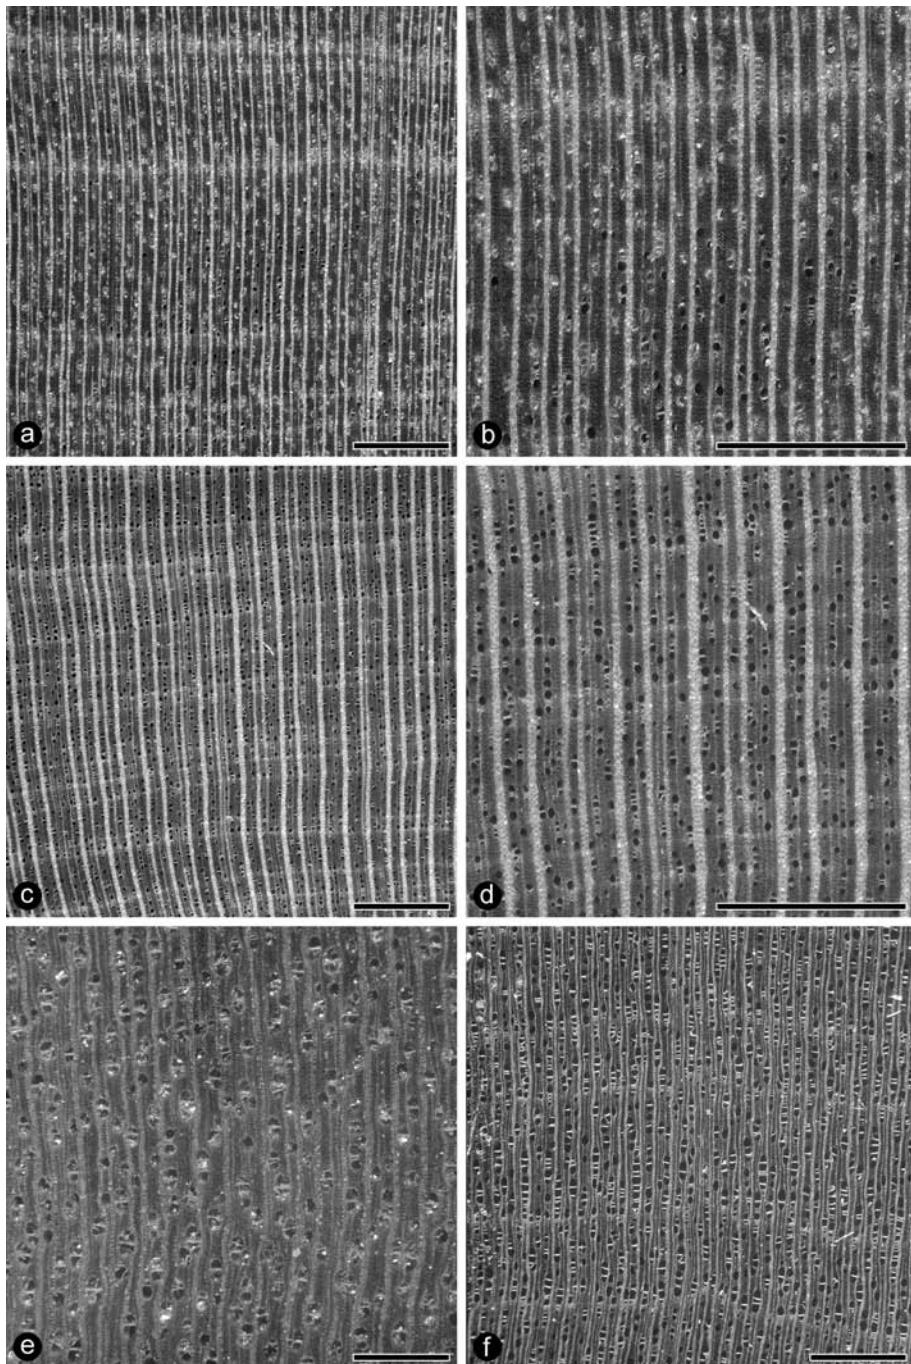

Fig. 35. a, b: *Flueggea acidoton* (Uw 18718). – c, d: *F. acidoton* (Uw 18723). – e: *F. flexuosa* (Uw 18727). – f: *F. leucopyrus* (Uw 11054). – Bar = 1 mm.

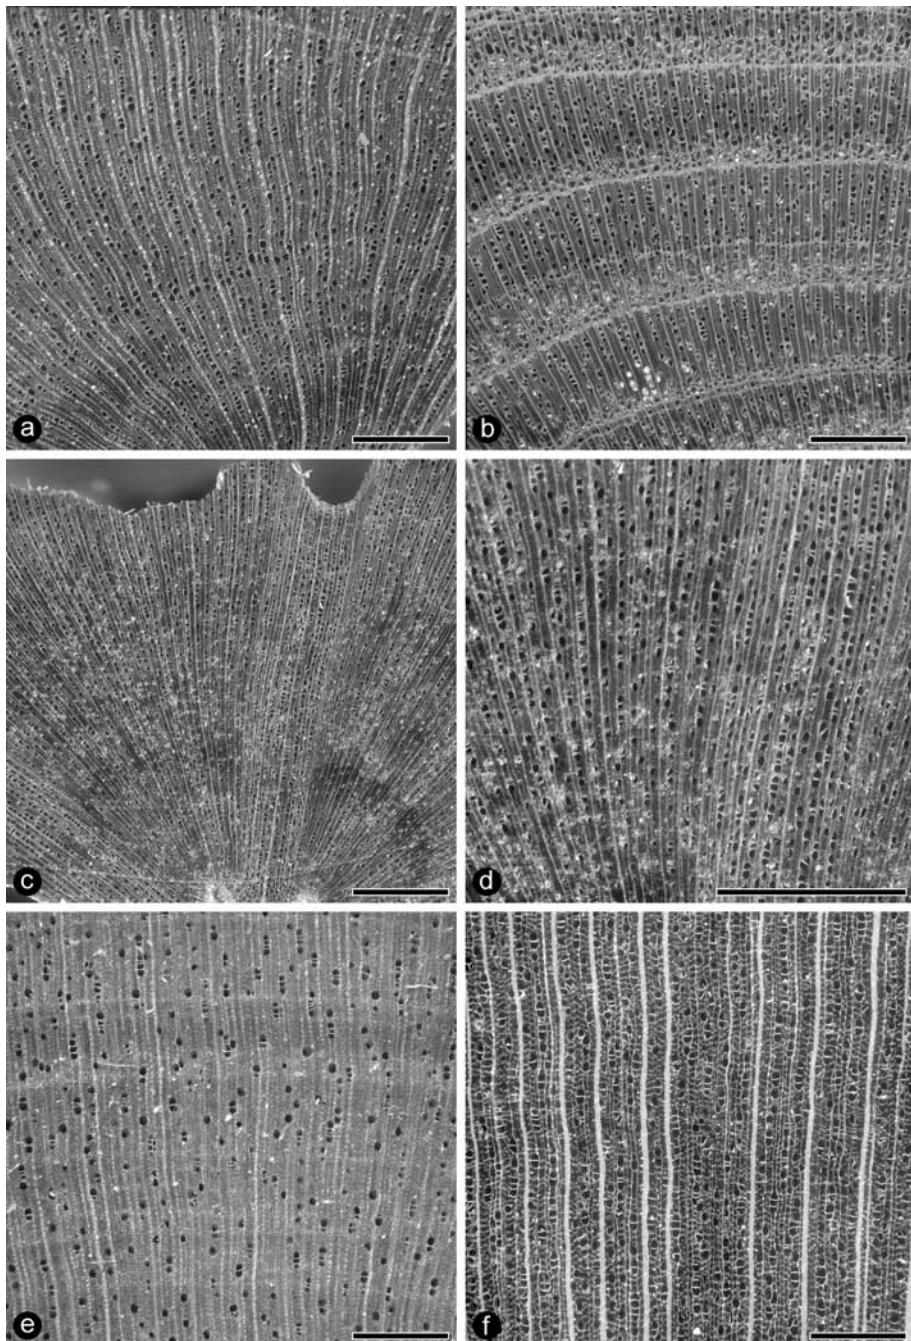

Fig. 36. a: *Flueggea neowawraea* (Uw 31194). – b: *F. suffruticosa* (UNw 410). – c, d: *F. virosa* subsp. *virosa* (Uw 14651). – e: *Fontainea picrosperma* (Uw 31203). – f: *Galearia celebica* (Uw 10895). – Bar = 1 mm.

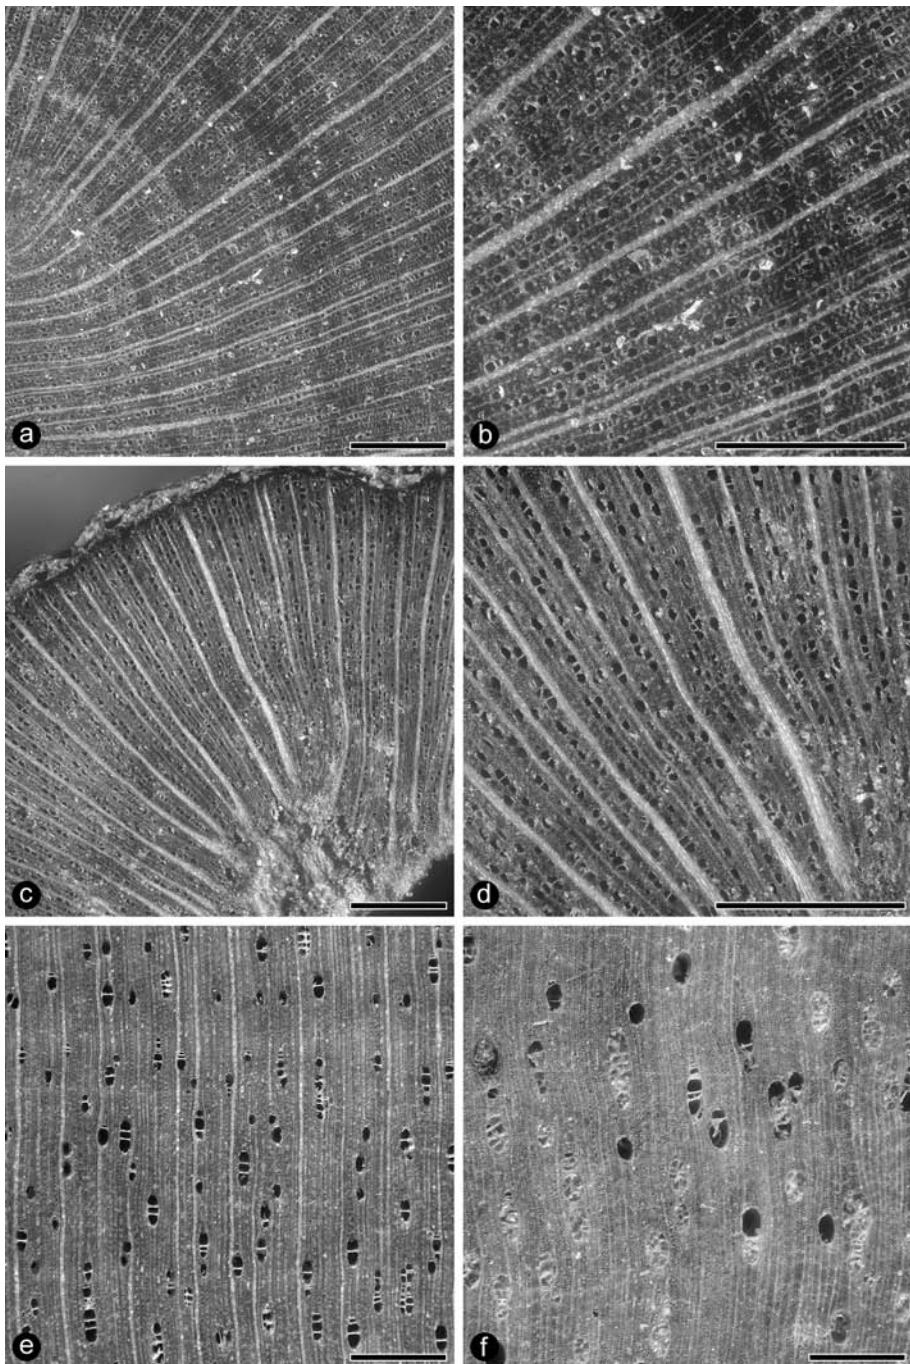

Fig. 37. a, b: *Galearia filiformis* (Uw 36892). – c, d: *G. phlebocarpa* (Uw 36891). – e: *Garcia nutans* (Uw 14807). – f: *Gavarretia terminalis* (Uw 16073). – Bar = 1 mm.

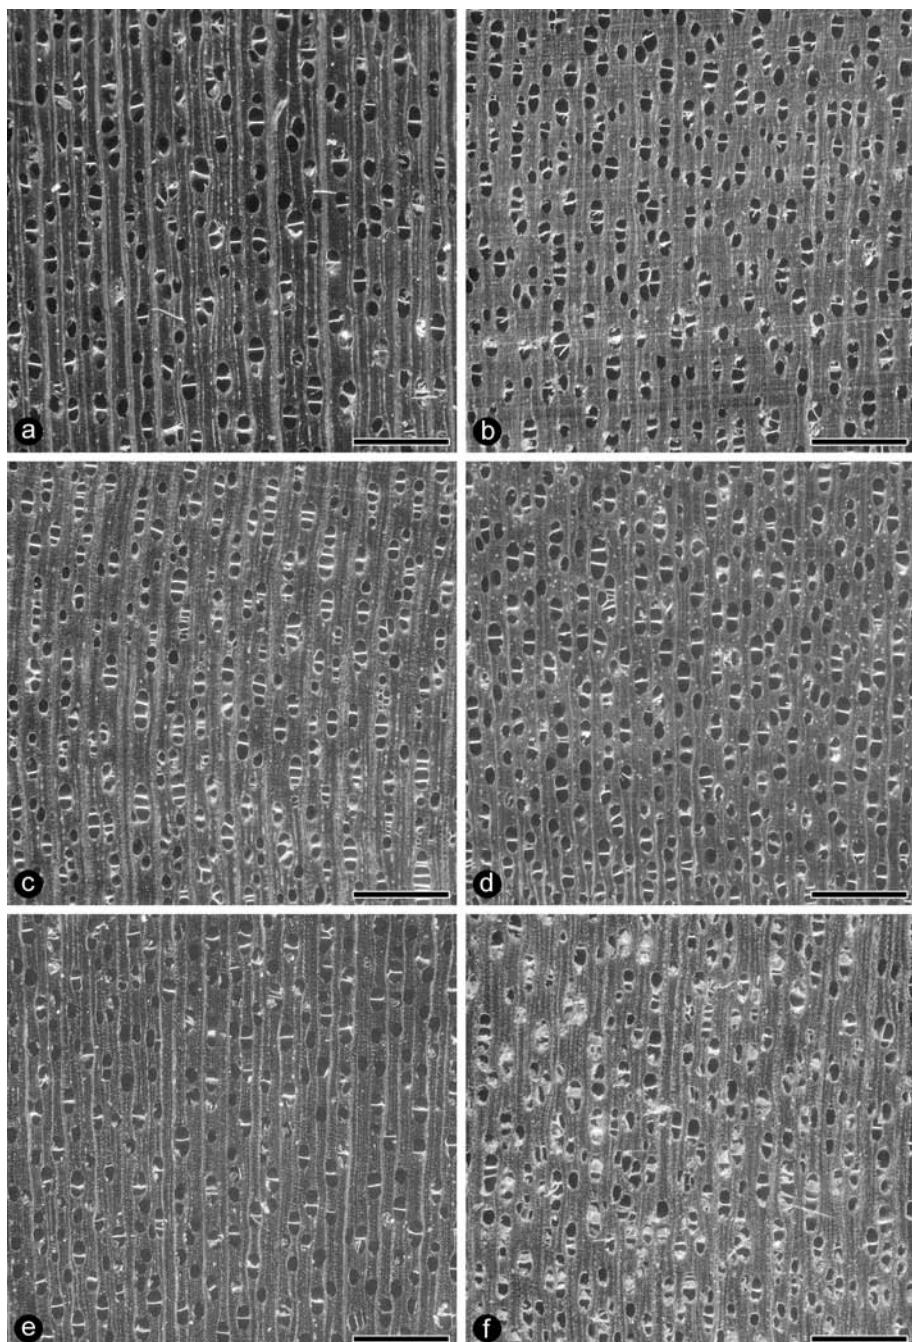

Fig. 38. a: *Glochidion borneense* (Uw 10896). – b: *G. capitatum* (Uw 10902). – c: *G. ferdinandi* (Uw 21328). – d: *G. obscurum* (Uw 10906). – e: *G. philippicum* (Uw 10903). – f: *G. philippicum* (Uw 15288). – Bar = 1 mm.

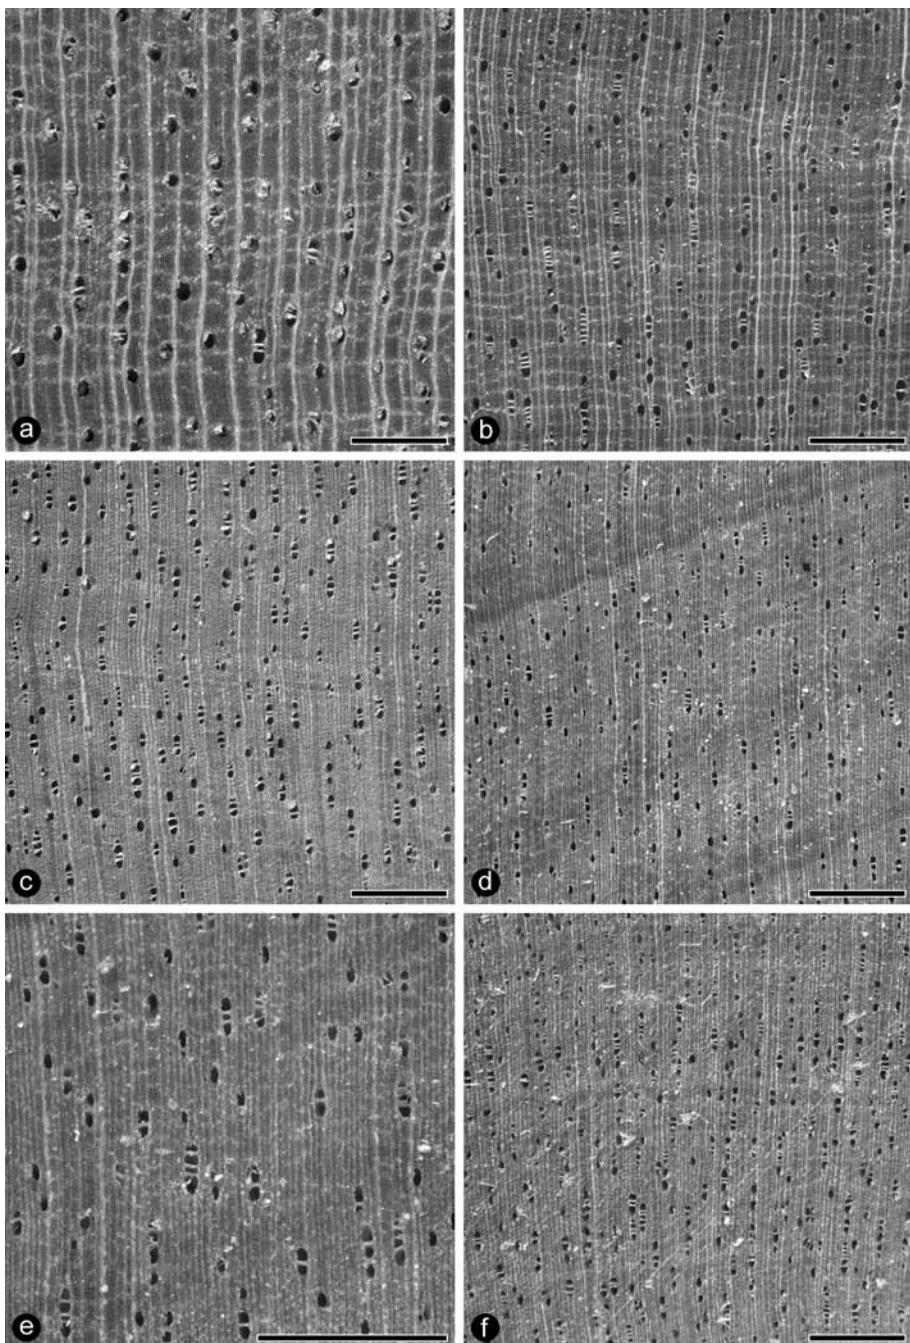

Fig. 39. a: *Glycydendron amazonicum* (Uw 7781). – b: *Grossera macrantha* (Uw 22176). – c: *Gymnanthes klotzschiana* var. *klotzschiana* (Uw 13234). – d, e: *G. klotzschiana* var. *klotzschiana* (Uw 14072). – f: *G. klotzschiana* var. *trichoneura* (Uw 12965). – Bar = 1 mm.

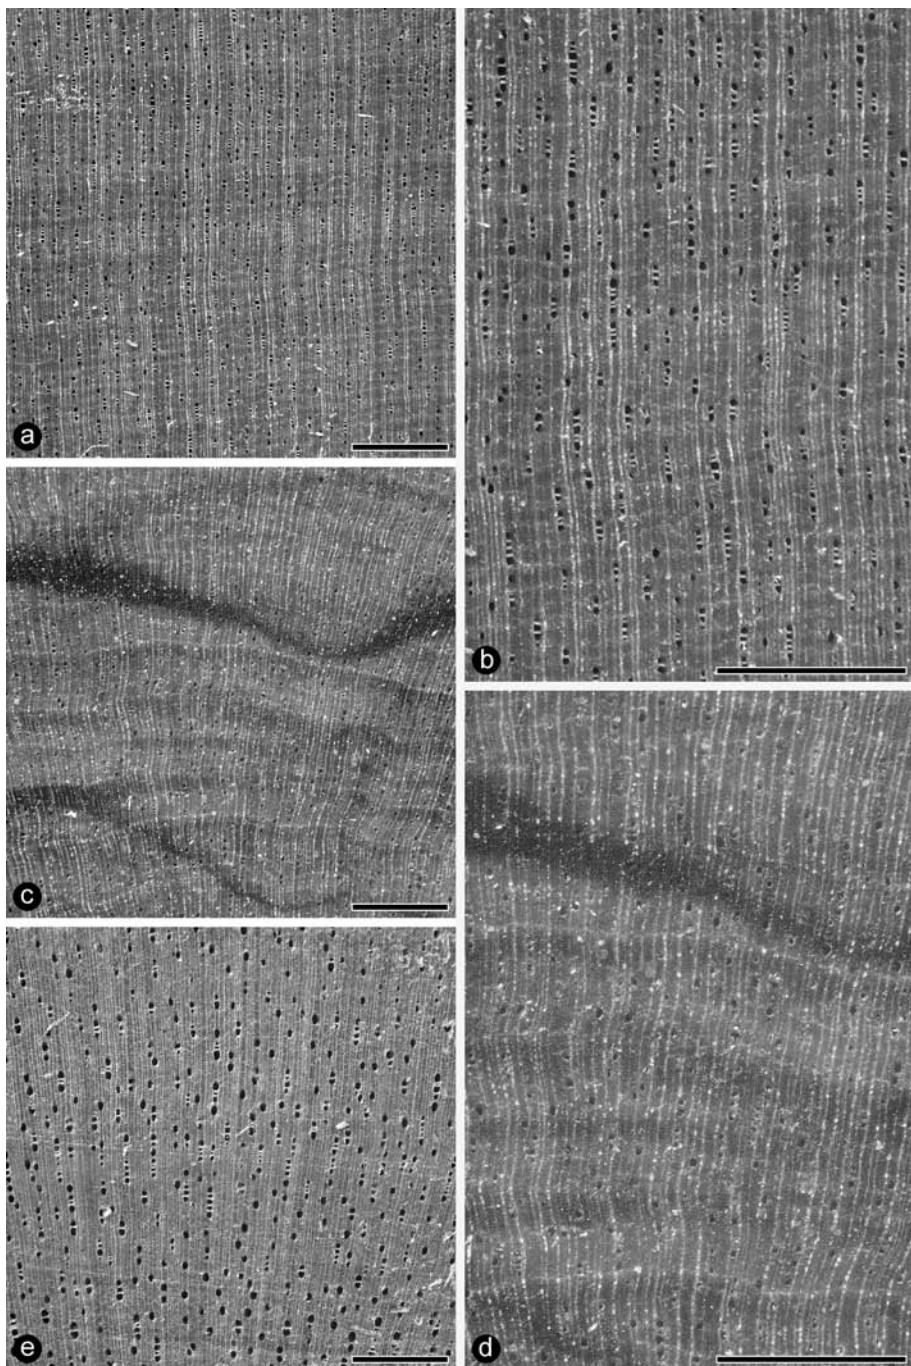

Fig. 40. a; b: *Gymnanthes lucida* (Uw 6309). – c, d: *G. lucida* (Uw 10204). – e: *G. schottiana* (Uw 14355). – Bar = 1 mm.

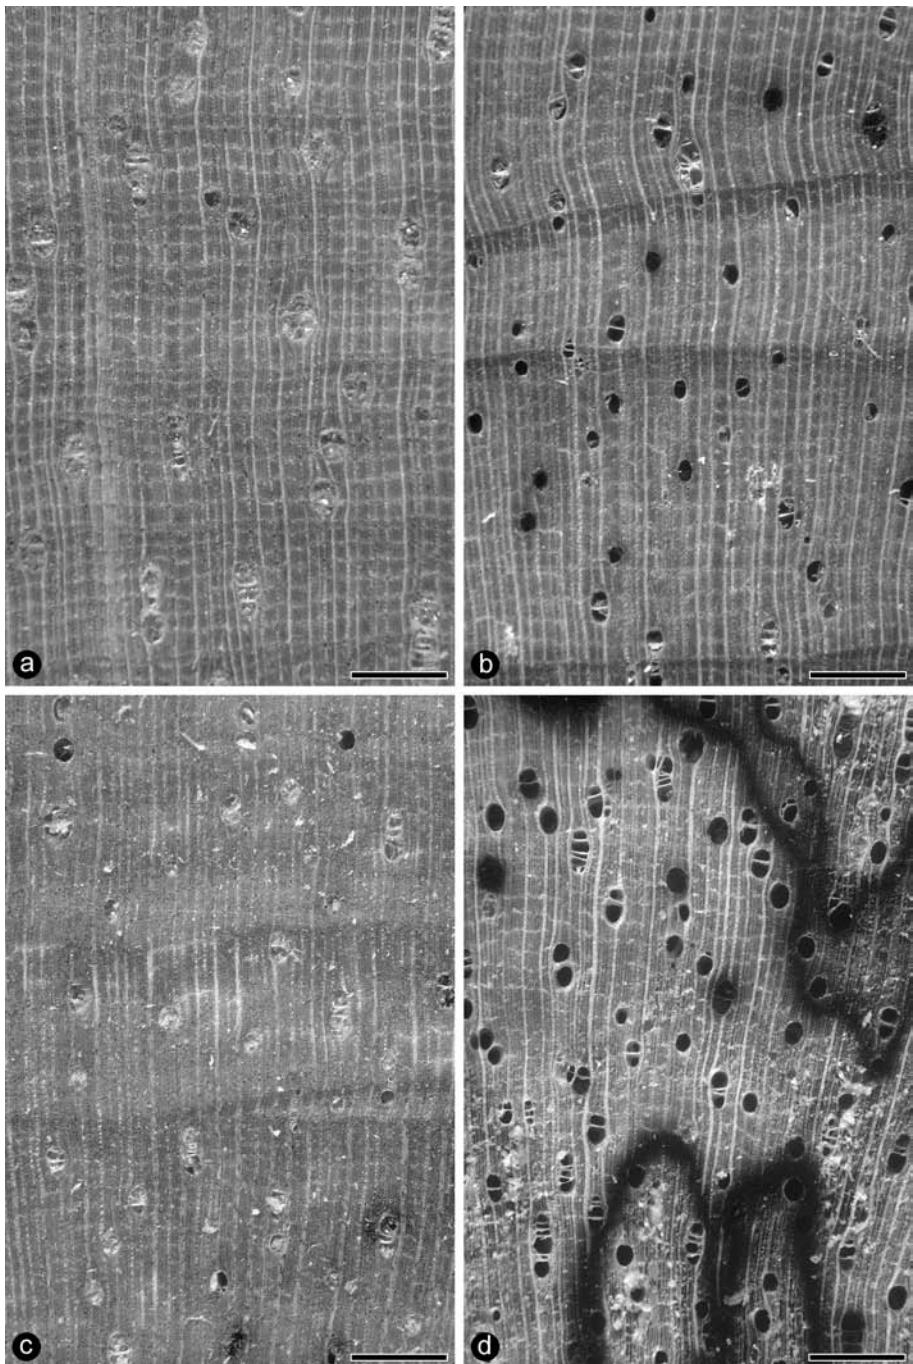

Fig. 41. a: *Hevea guianensis* (Uw 155). – b: *H. pauciflora* var. *coriacea* (Uw 869). – c: *H. pauciflora* var. *coriacea* (Uw 2720). – d: *H. spruceana* (Uw 7541). – Bar = 1 mm.

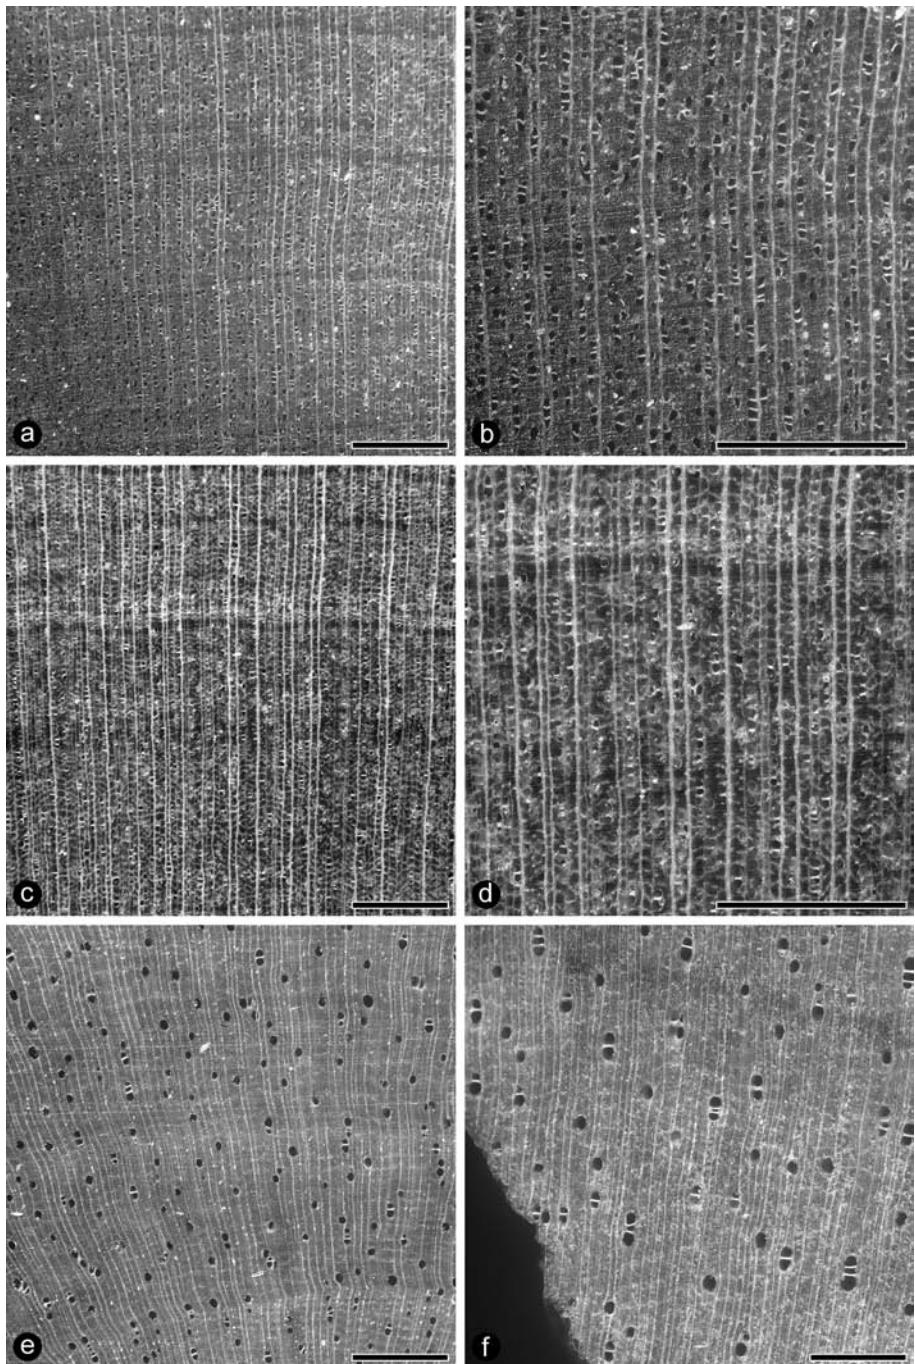

Fig. 42. a, b: *Heywoodia lucens* (Uw 10952). – c, d: *H. lucens* (Uw 10953). – e: *Hippomane mancinella* (Uw 6195). – f: *H. mancinella* (Uw 25945). – Bar = 1 mm.

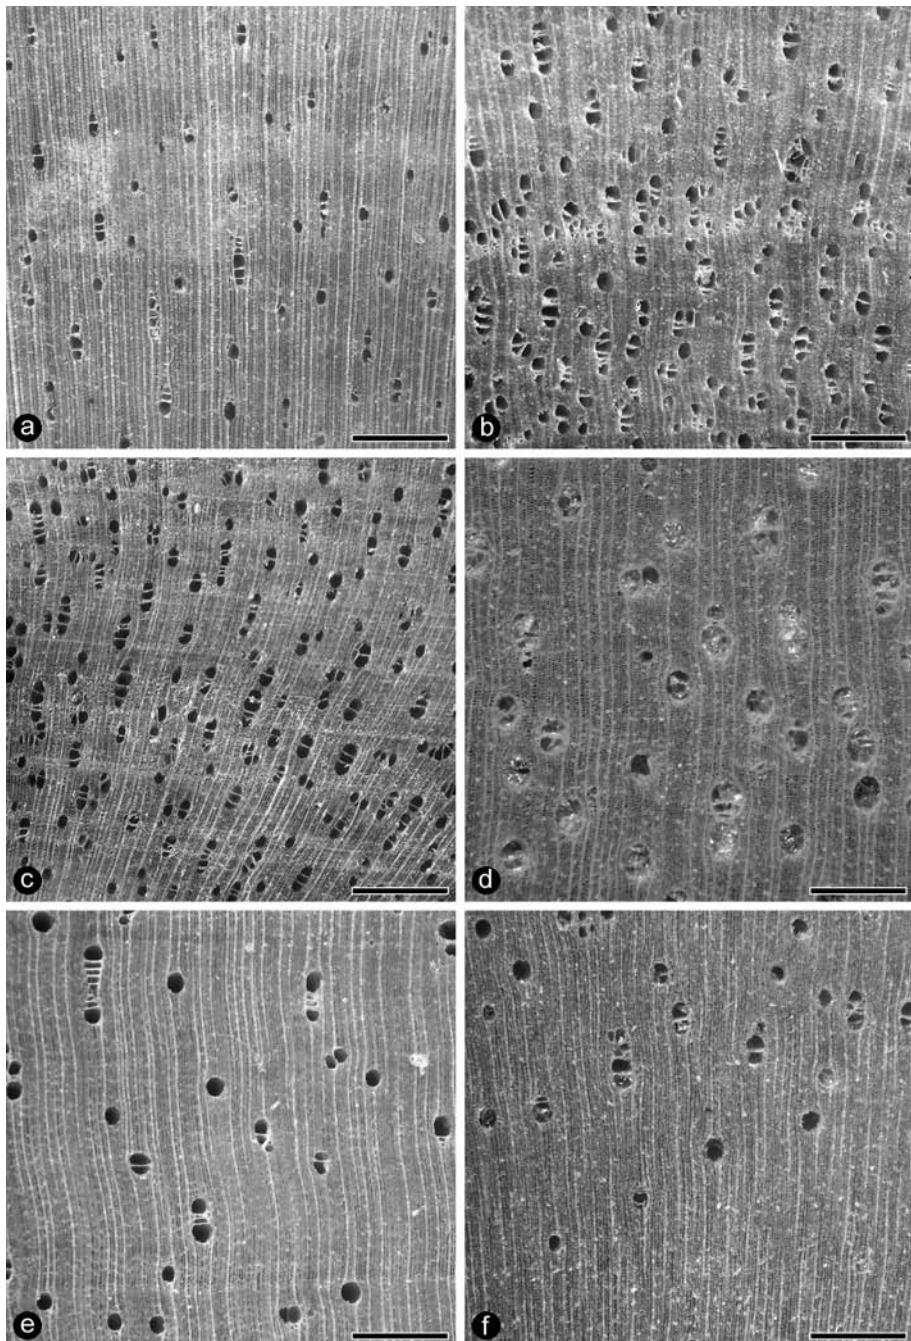

Fig. 43. a: *Homalanthus arfakiensis* (Uw 18326). – b: *H. fastuosus* (Uw 33734). – c: *H. fastuosus* (Uw 33747). – d: *Hura crepitans* (Uw 52). – e: *H. crepitans* (Uw 19177). – f: *H. polyandra* (Uw 10373). – Bar = 1 mm.

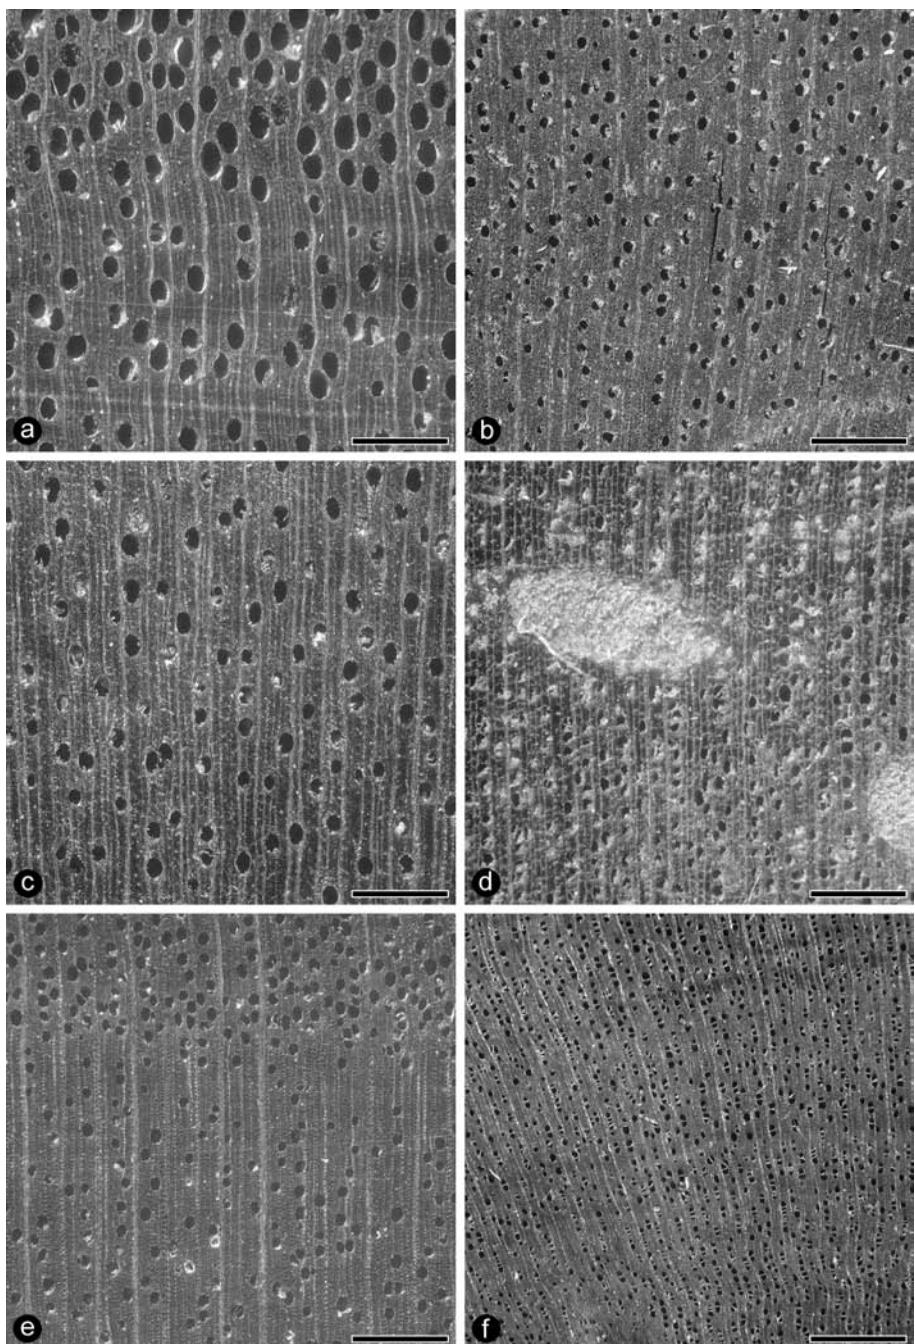

Fig. 44. a: *Hieronyma [Hyeronima] alchorneoides* var. *alchorneoides* (Uw 16261). – b: *H. jamaicensis* (Uw 31049). – c: *H. laxiflora* (Uw 102). – d: *H. macrocarpa* (Uw 31047). – e: *H. oblonga* (Uw 16259). – f: *Hymenocardia acida* (Uw 24544). – Bar = 1 mm.

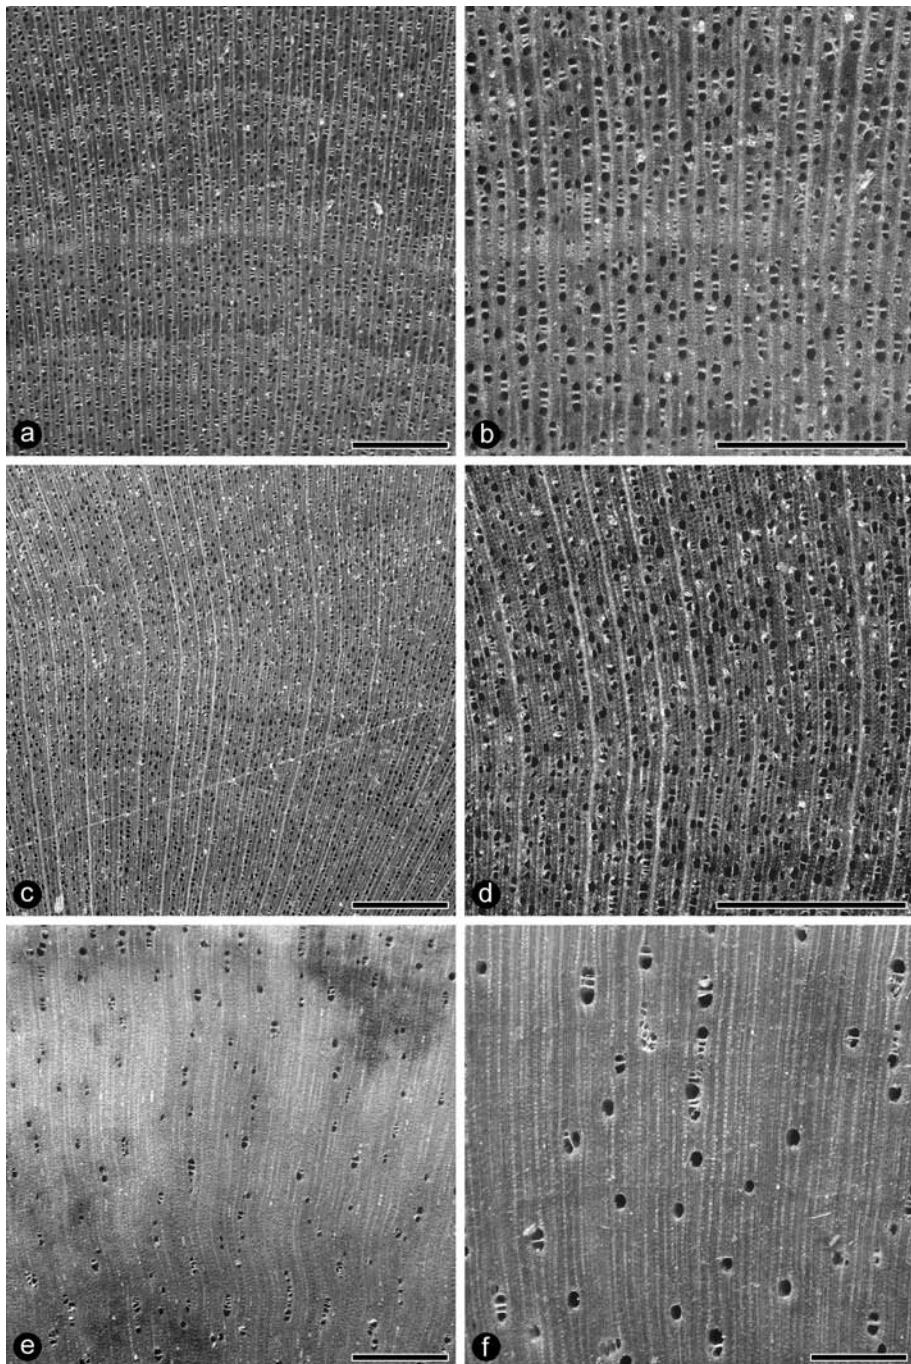

Fig. 45. a, b: *Hymenocardia ulmoides* (Uw 15880). – c, d: *Jablonskia congesta* (Uw 18724). – e: *Jatropha curcas* (Uw 21178). – f: *J. curcas* (Uw 21737). – Bar = 1 mm.

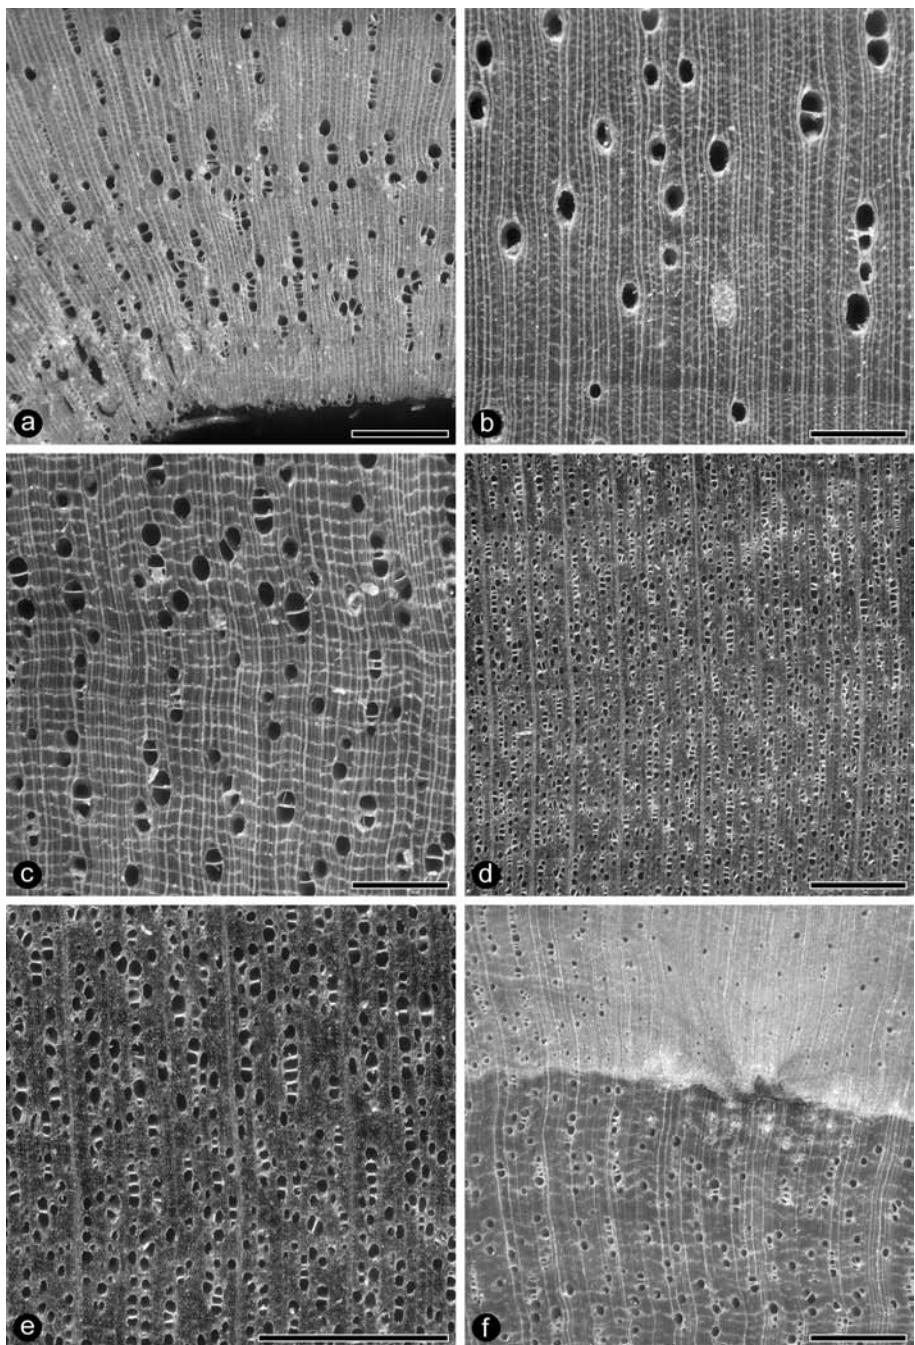

Fig. 46. a: *Jatropha platyphylla* (Uw 31197). – b: *Joannesia heveoides* (Uw 19247). – c: *Klaineanthus gaboniae* (Uw 22178). – d, e: *Lachnostylis hirta* (Uw 22179). – f: *Leucocroton wrightii* (Uw 36890). – Bar = 1 mm.

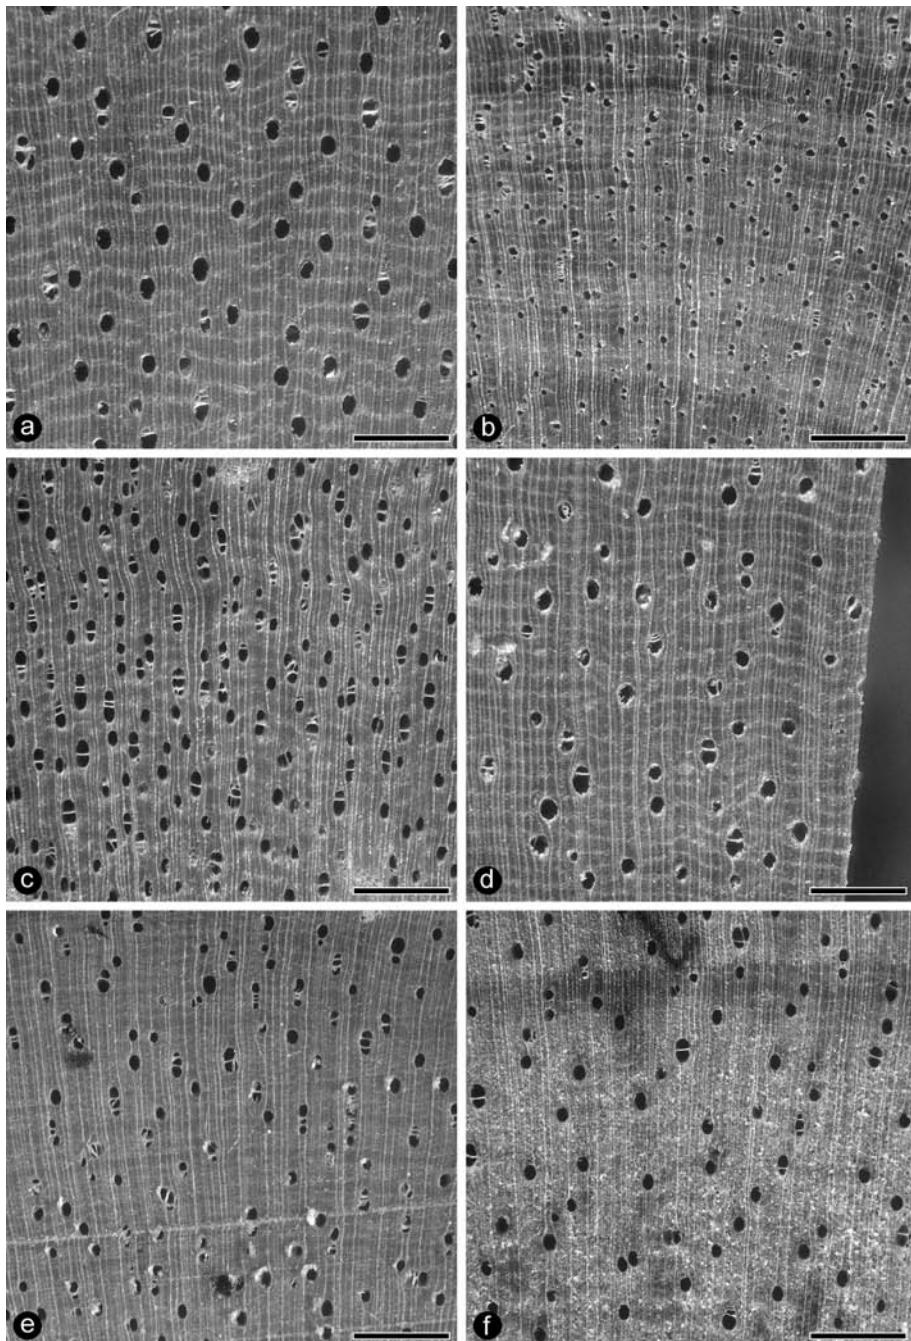

Fig. 47. a: *Mabea angularis* (Uw 19380). – b: *M. klugei* (Uw 8205). – c: *M. montana* subsp. *montana* (Uw 14815). – d: *M. nitida* (Uw 19055). – e: *M. occidentalis* (U 22562). – f: *M. paniculata* (Uw 19286a). – Bar = 1 mm.

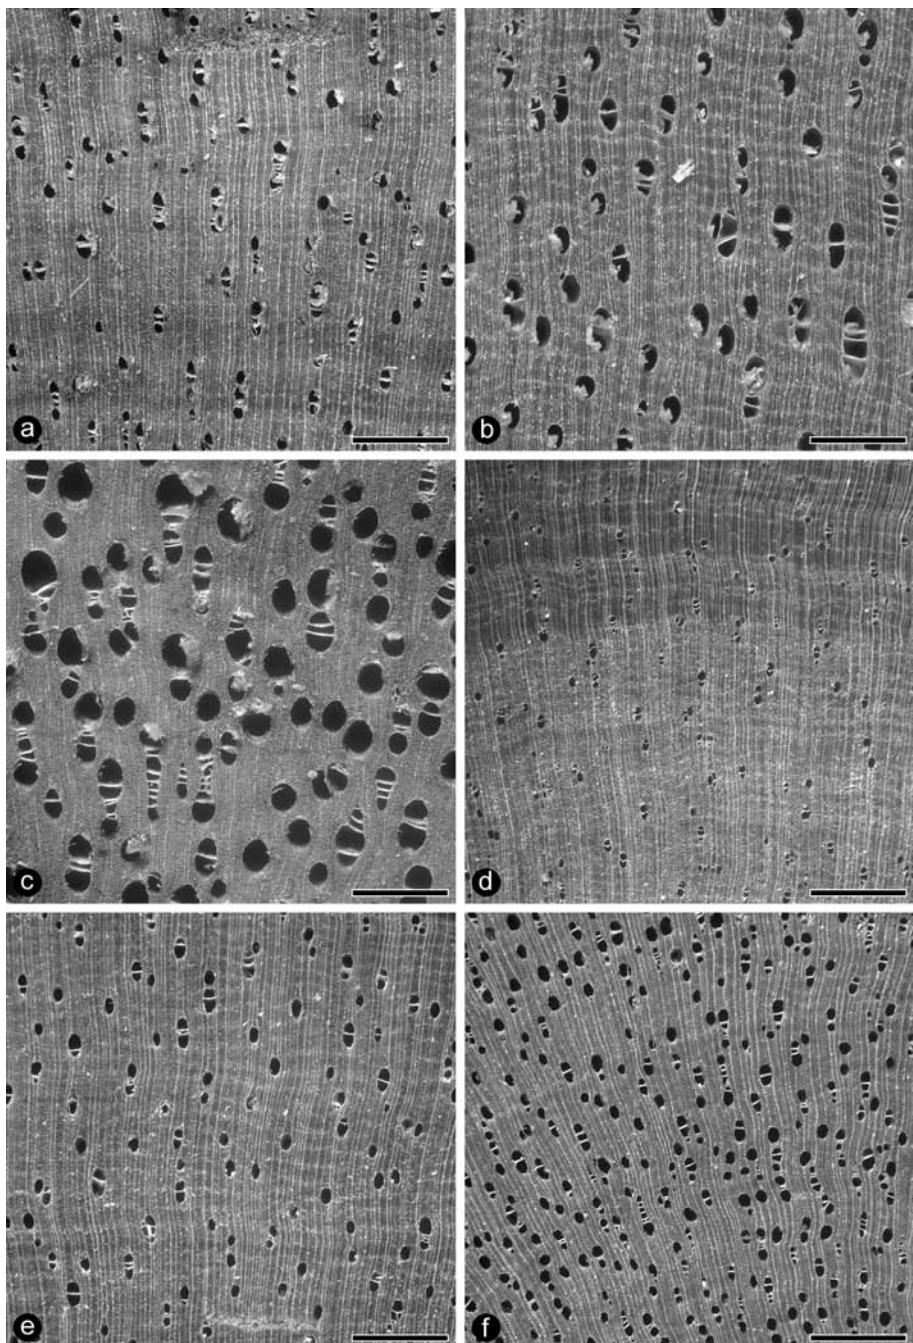

Fig. 48. a: *Mabea piriri* (Uw 7518). – b: *M. piriri* (Uw 22782). – c: *M. pulcherrima* (Uw 27505). – d: *M. speciosa* subsp. *guianensis* (Uw 8613). – e: *M. speciosa* subsp. *speciosa* (Uw 1965). – f: *M. taquari* (Uw 2960). – Bar = 1 mm.

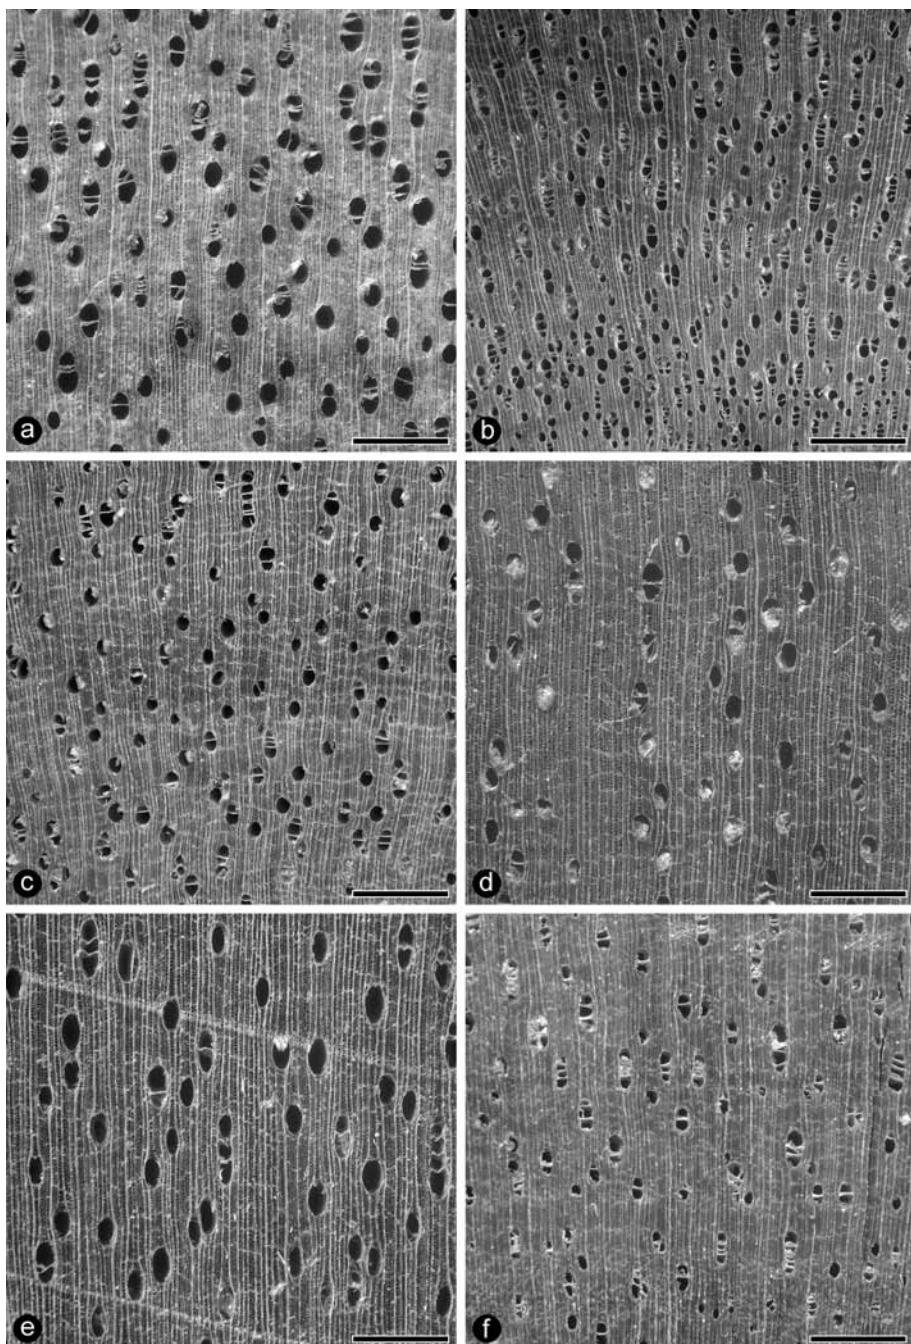

Fig. 49. a: *Macaranga aleuritoides* (Uw 27702). – b: *M. aleuritoides* (Uw 31196). – c: *M. conifera* (Uw 31786). – d: *M. fimbriata* (Uw 28074). – e: *M. fragrans* (Uw 28929). – f: *M. kilimandscharica* (Uw 15924). – Bar = 1 mm.

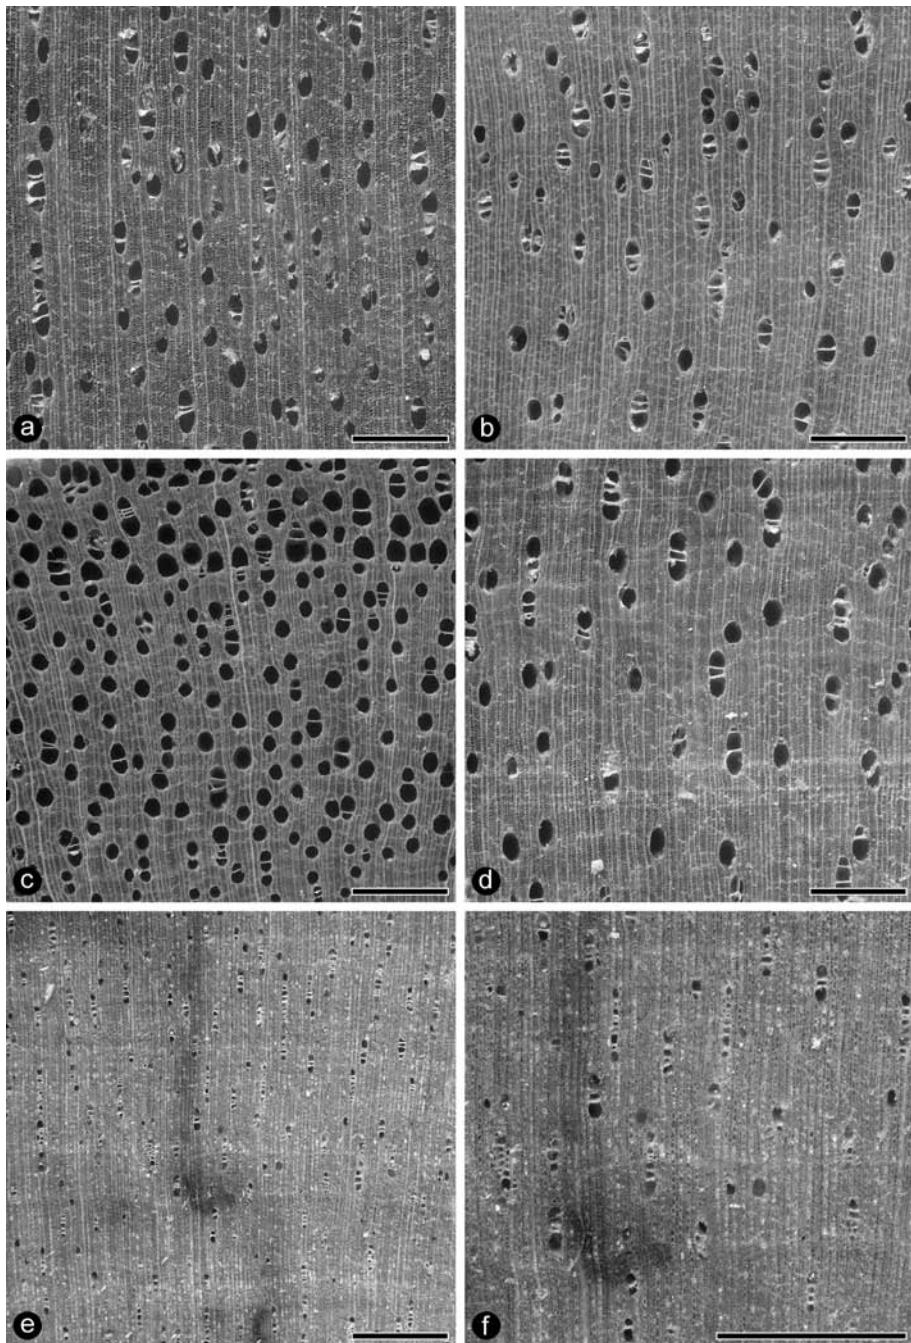

Fig. 50. a: *Macaranga polyadenia* (Uw 28378). – b: *M. roxburghii* (Uw 32713). – c: *M. schweinfurthii* (Uw 9269). – d: *M. spinosa* (Uw 6580). – e, f: *Mallotus claoxyloides* (Uw 21322). – Bar = 1 mm.

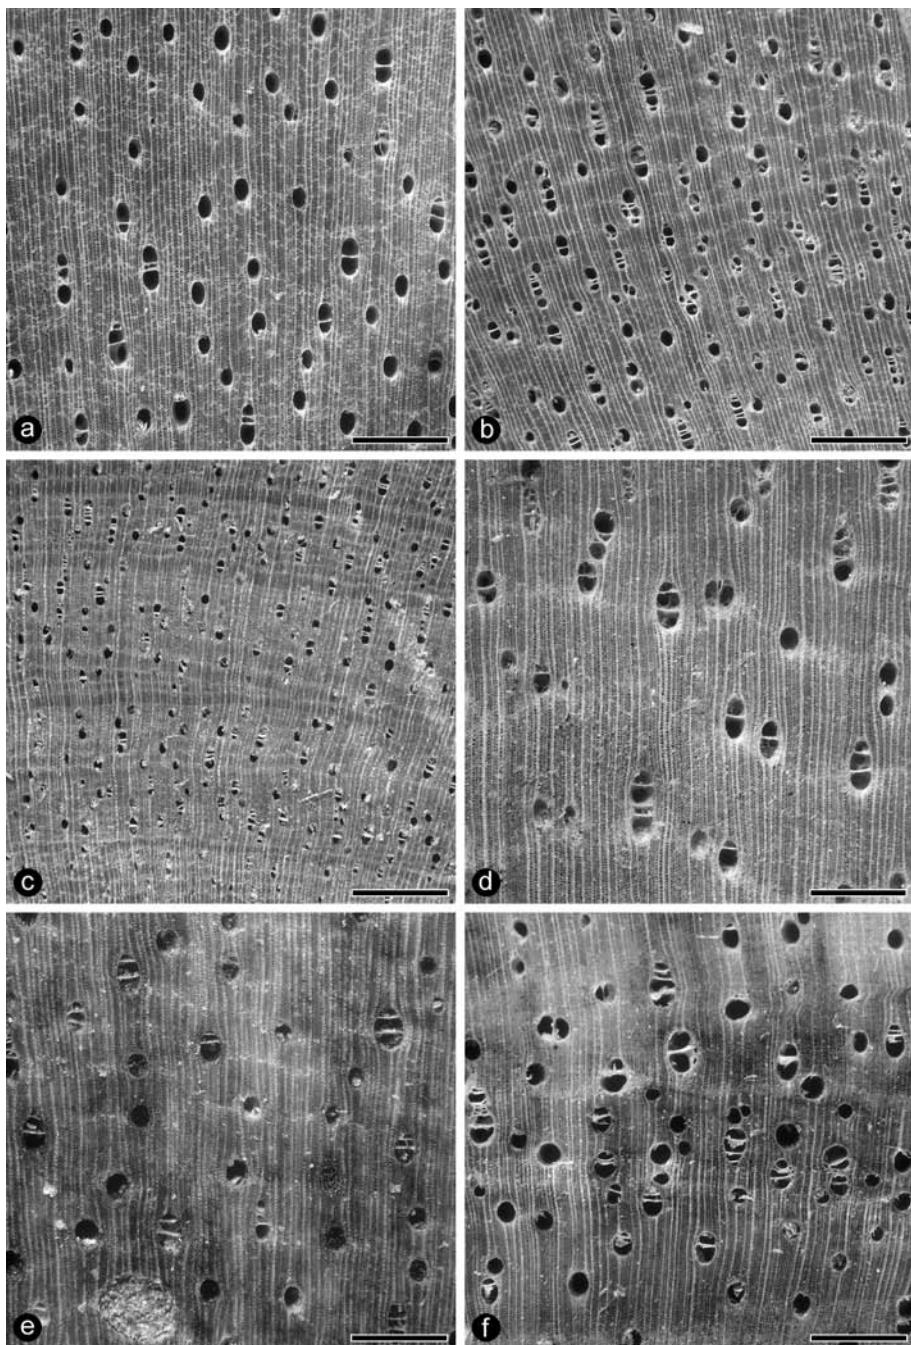

Fig. 51. a: *Mallotus confusus* (Uw 10783). – b: *M. mollissimus* (Uw 10758). – c: *M. polyadenus* (Uw 31199). – d: *Manihot carthagenensis* subsp. *glaziovii* (Uw 30856). – e: *M. esculenta* (Uw 24545). – f: *M. grahamii* (Uw 14045). – Bar = 1 mm.

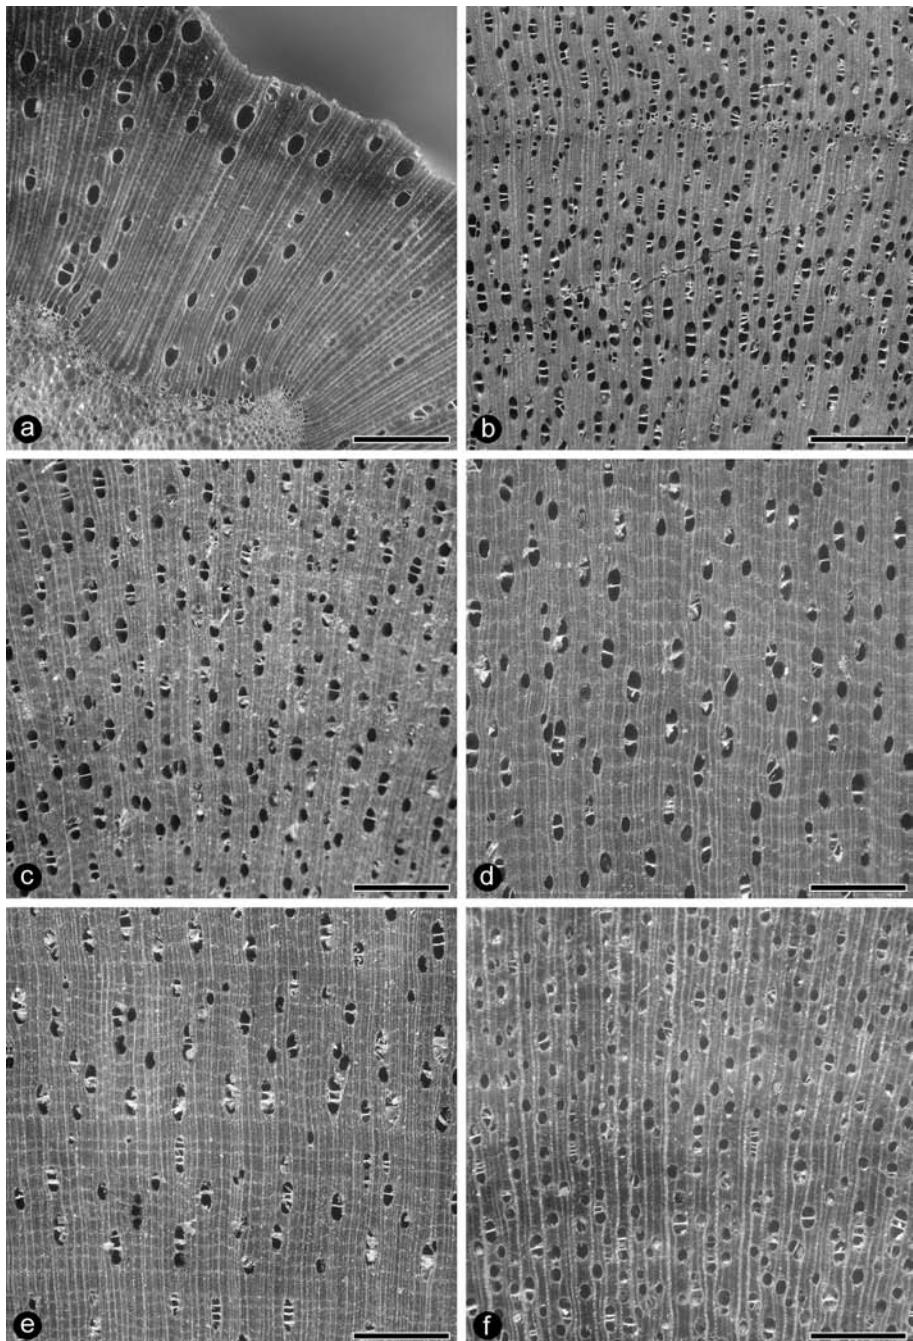

Fig. 52. a: *Manniophyton fulvum* (Uw 22180). – b: *Maprounea africana* (Uw 15818). – c: *M. brasiliensis* (Uw 16610). – d: *M. guianensis* (Uw 872). – e: *M. guianensis* (Uw 11187). – f: *Mareya micrantha* (Uw 22181). – Bar = 1 mm.

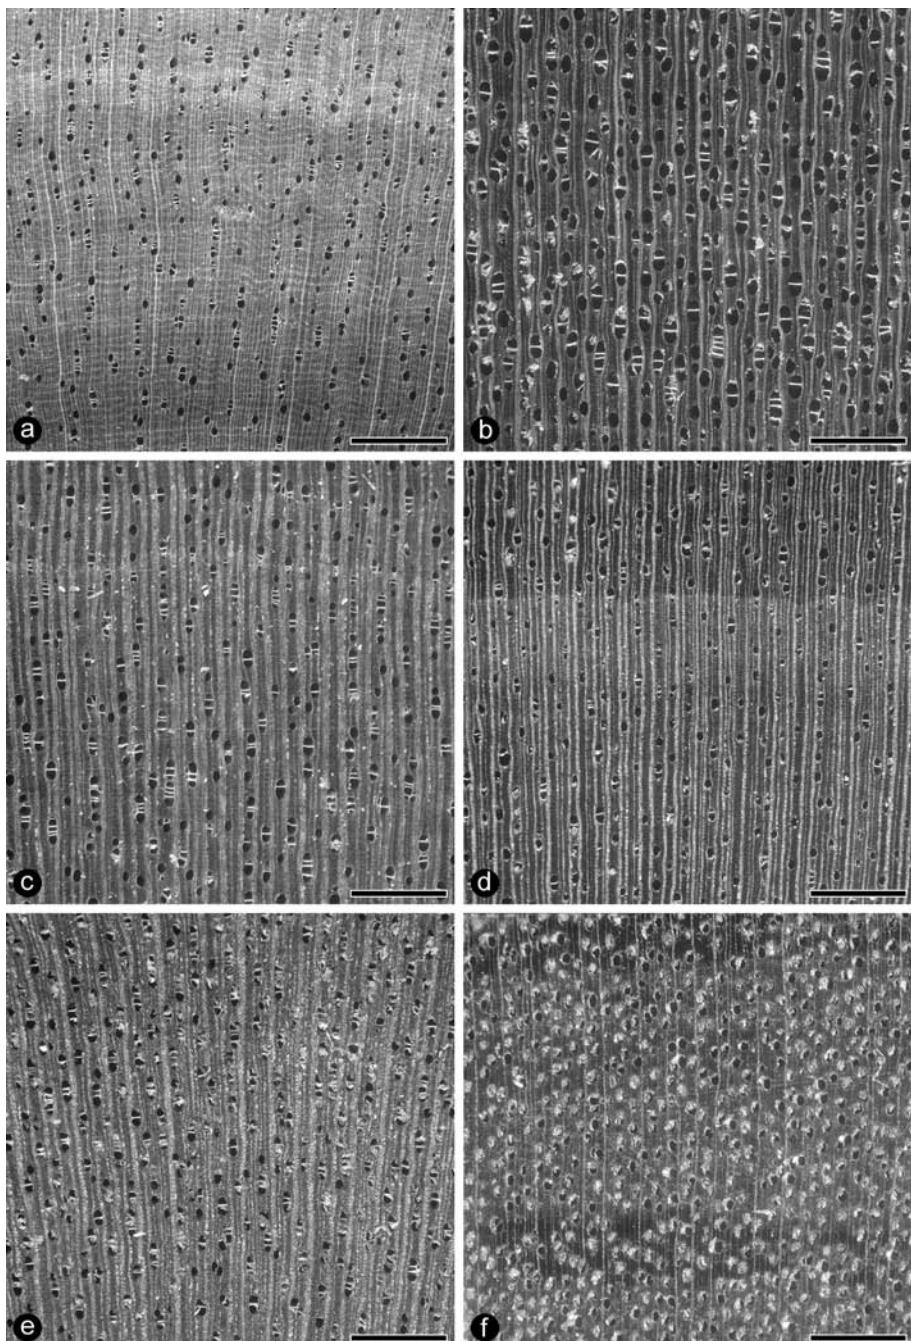

Fig. 53. a: *Mareyopsis oligogyna* (Uw 35080). – b: *Margaritaria discoidea* (Uw 10910). – c: *M. discoidea* (Uw 25934). – d: *M. nobilis* (Uw 7466). – e: *M. nobilis* (Uw 8376). – f: *Martretia quadricornis* (Uw 15478). – Bar = 1 mm.

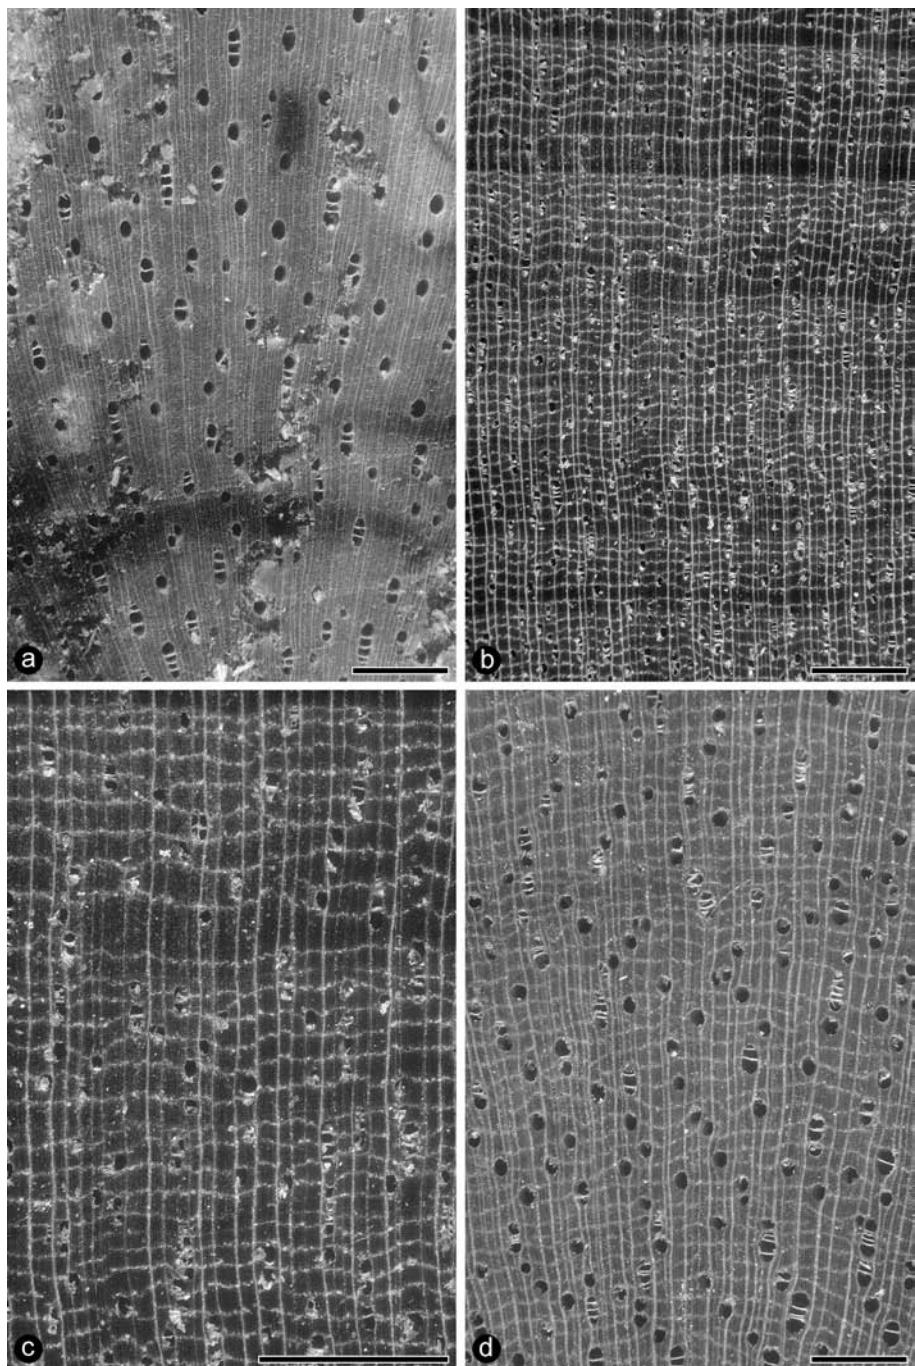

Fig. 54. a: *Melanolepis multiglandulosa* (Uw 36889). – b, c: *Micrandra elata* (Uw 1838). – d: *M. siphonoides* (Uw 9121). – Bar = 1 mm.

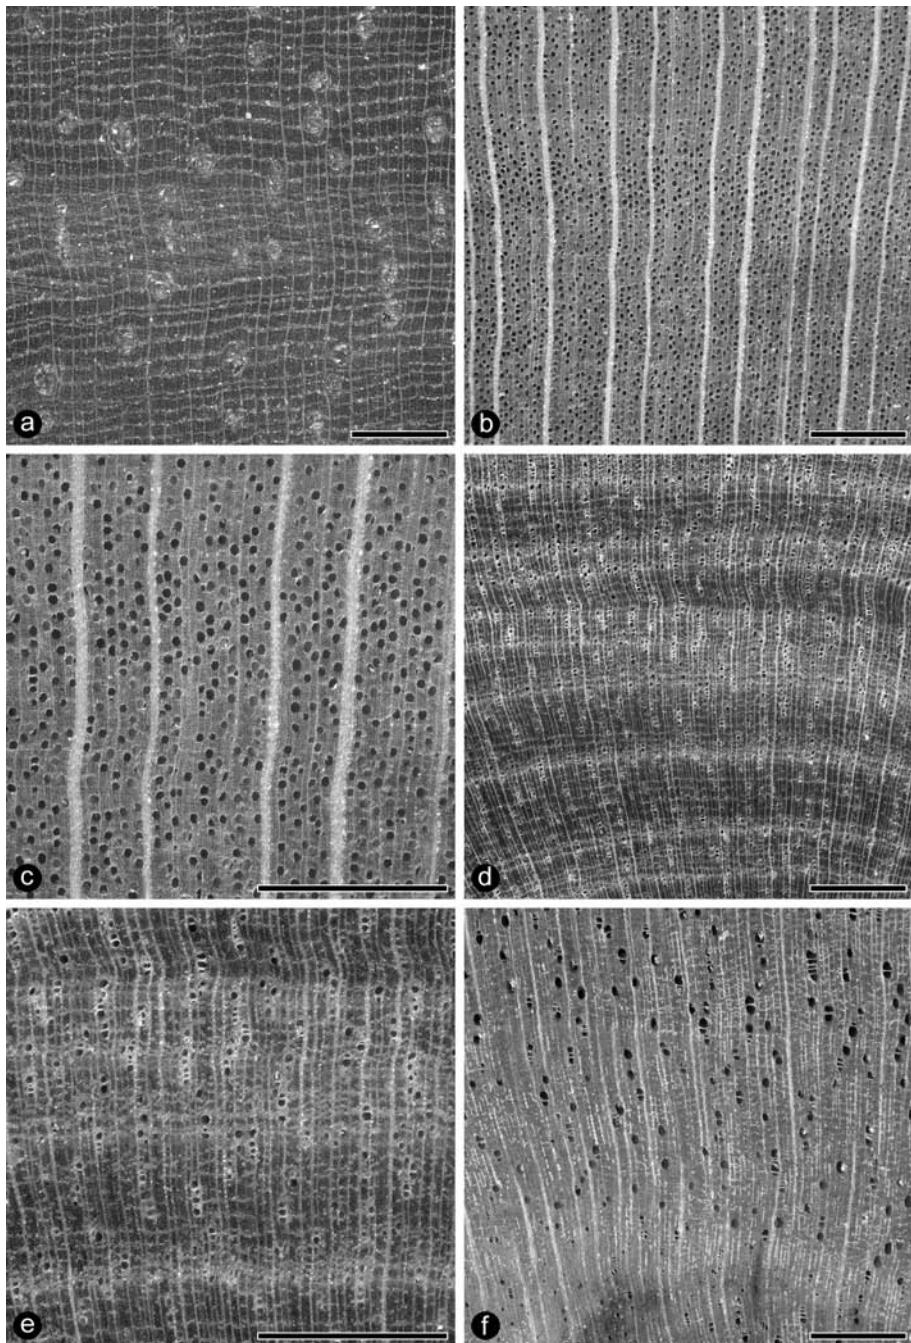

Fig. 55. a: *Micrandropsis scleroxylon* (Uw 20753). b, c: *Microdesmis puberula* (Uw 15480). – d, e: *Mischodion zeylanicus* (Uw 36882). – f: *Moultonianthus leembruggianus* (Uw 31770). – Bar = 1 mm.

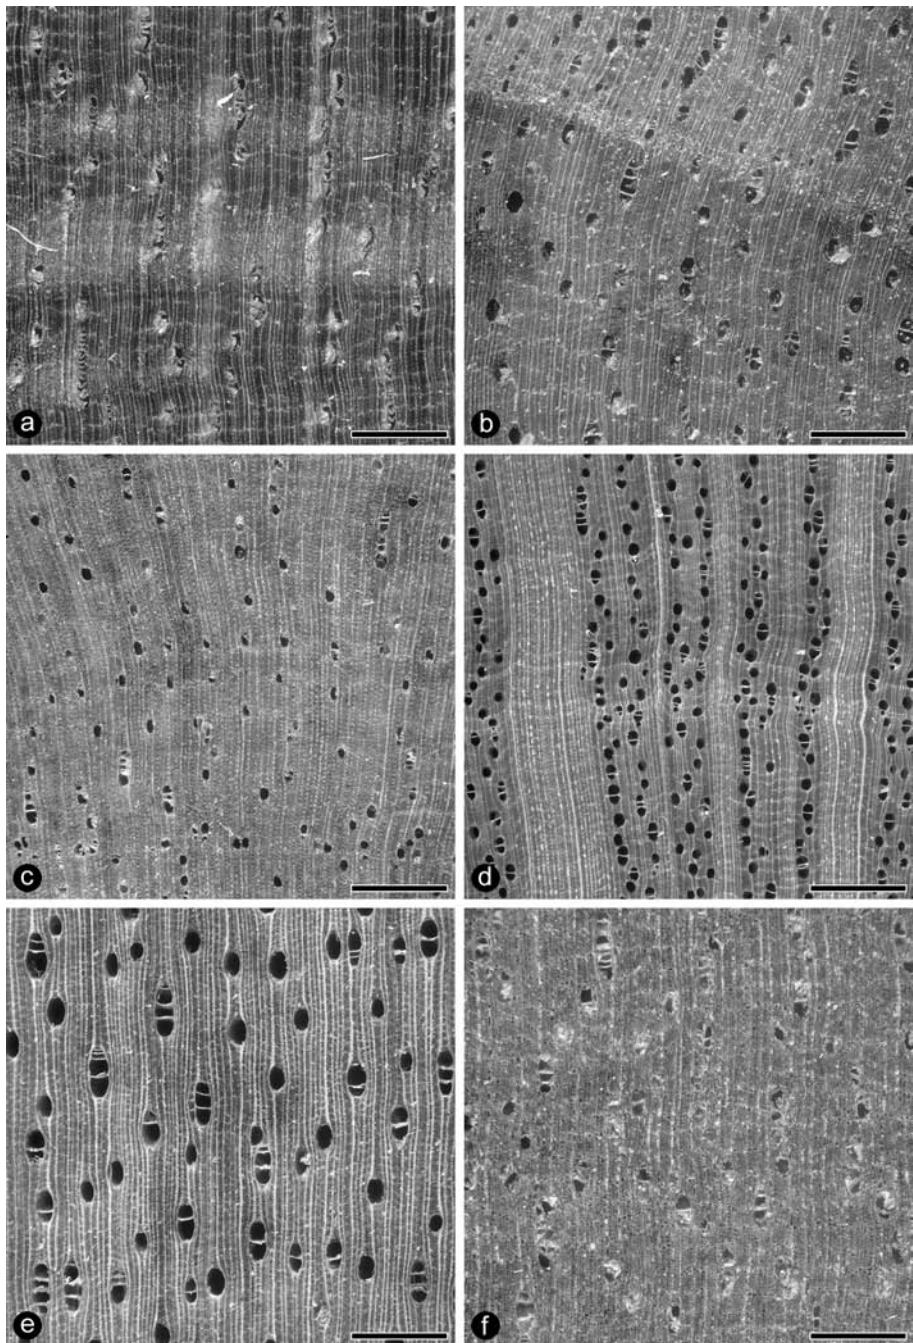

Fig. 56. c: *Nealchornea stipitata* (Uw 7661). – a: *N. yapurensis* (Uw 16162). – b: *N. yapurensis* (Uw 19869). – d: *Necepsia afzelii* (Uw 22182). – e: *Neoboutonia macrocalyx* (Uw 21728). – f: *Neoguillauminia cleopatra* (Uw 33124). – Bar = 1 mm.

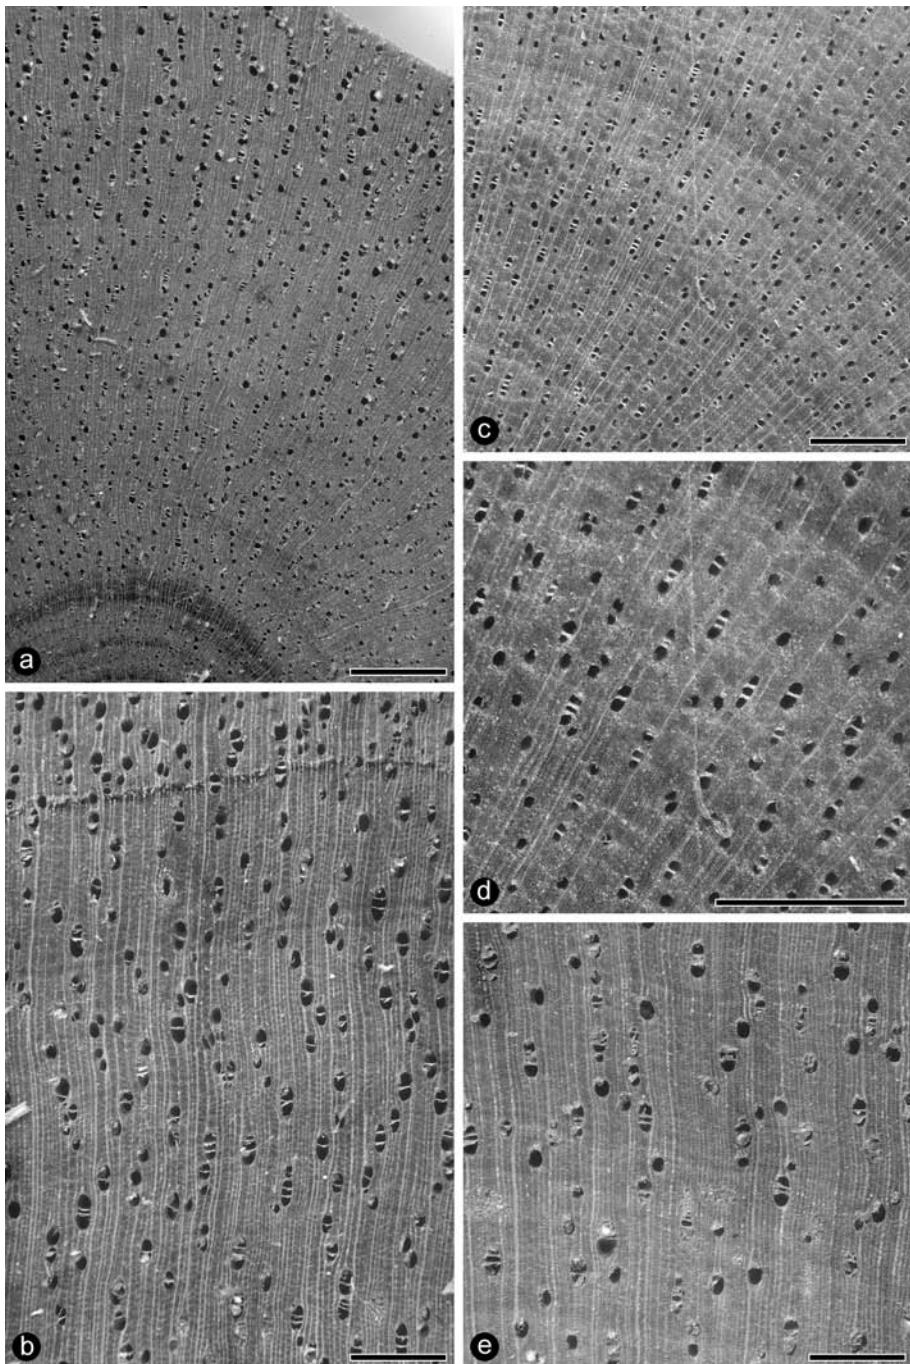

Fig. 57. a: *Neoscorchnia forbesii* (Uw 31870). – b: *N. nicobarica* (Uw 21368). – c, d: *Neoskirakia japonica* (Uw 31933) – e: *Neotrewia cumingii* (Uw 21369). – Bar = 1 mm.

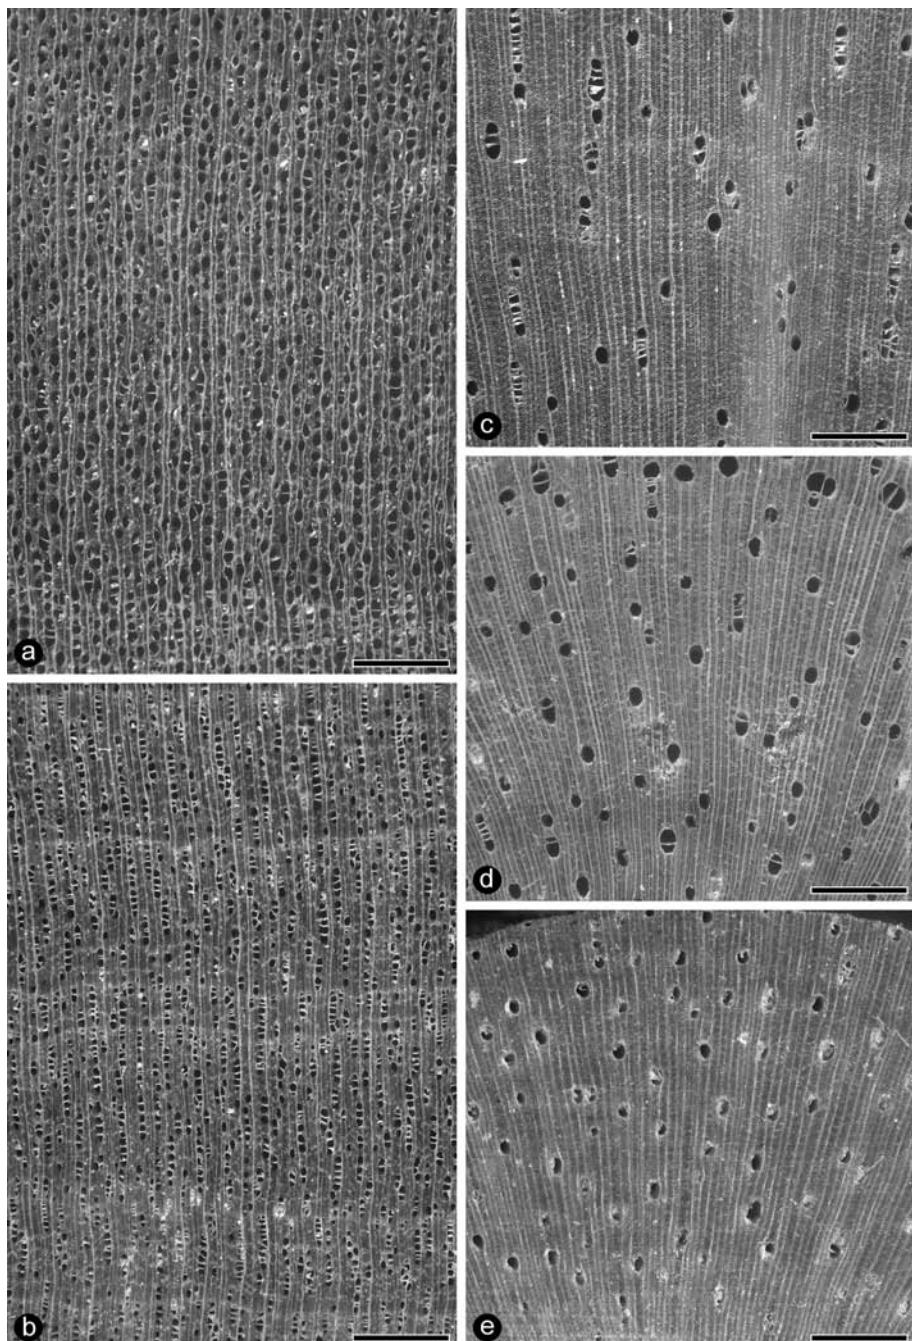

Fig. 58. a: *Oldfieldia africana* (Uw 14636). – b: *Oldfieldia dactylophylla* (Uw 10951). – c: *Omphalea diandra* (Uw 8349). – d: *O. diandra* (Uw 13834). – e: *O. queenslandiae* (Uw 31314). – Bar = 1 mm.

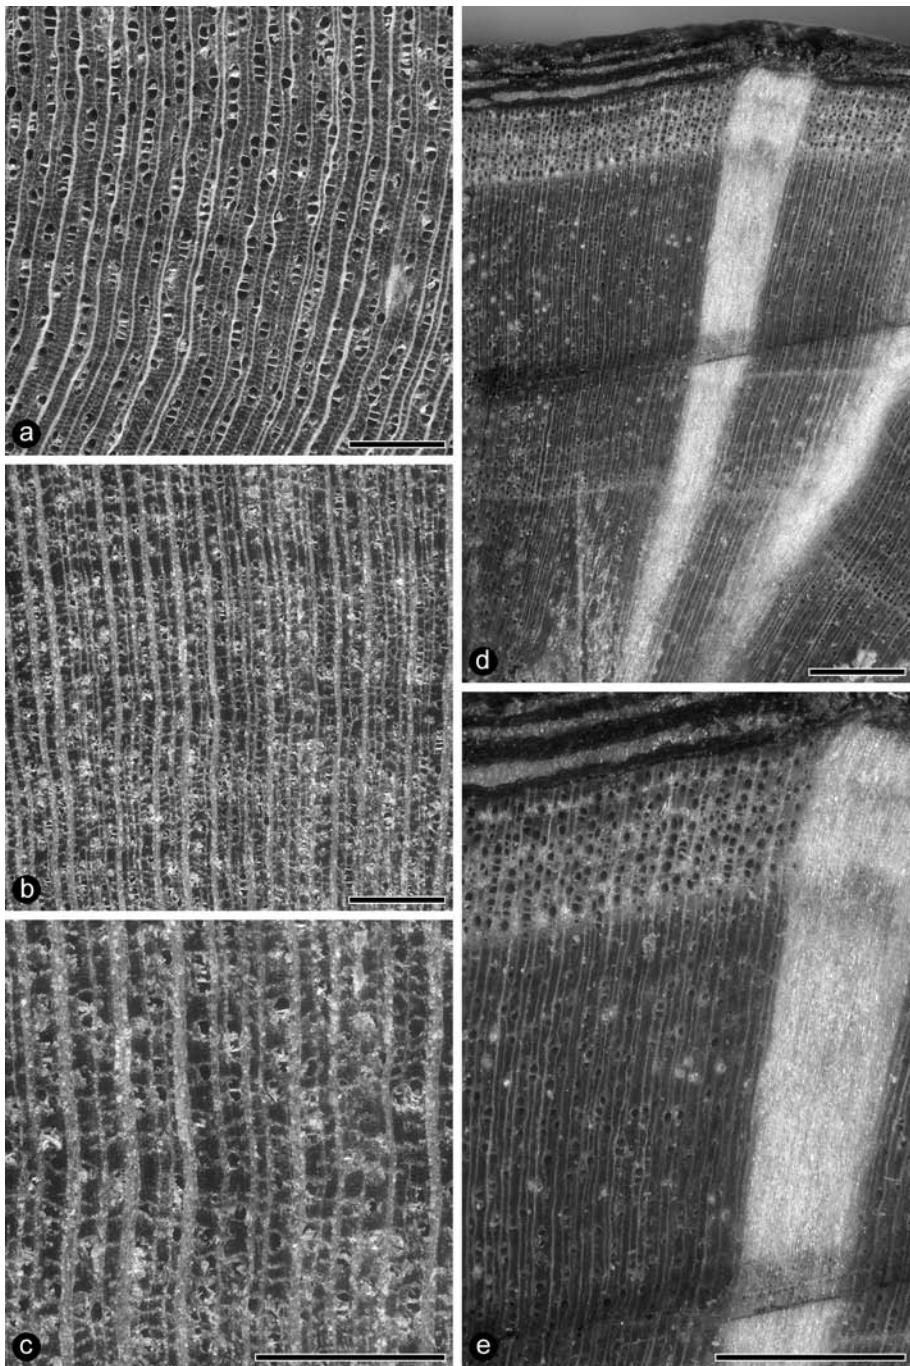

Fig. 59. a: *Panda oleosa* (Uw 18529). – b, c: *Paradrypetes subintegritolia* (Uw 20164). – d, e: *Parodiiodendron marginivillousum* (Uw 36884). – Bar = 1 mm.

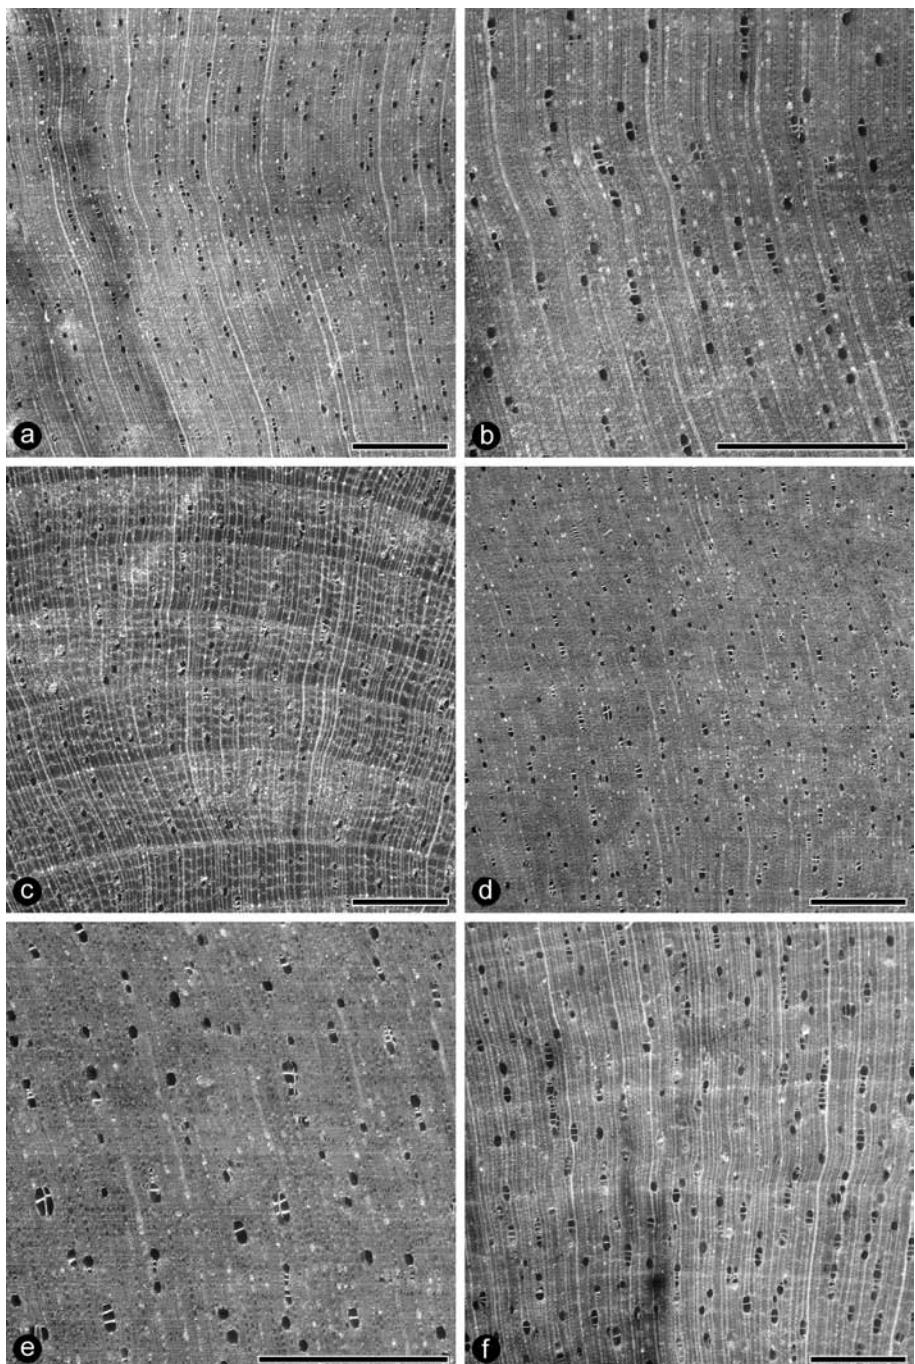

Fig. 60. a, b: *Pausandra hirsuta* (Uw 7469). – c: *P. martinii* (Uw 1973). – d, e: *P. martinii* (Uw 16852). – f: *P. morisiana* (Uw 6990). – Bar = 1 mm.

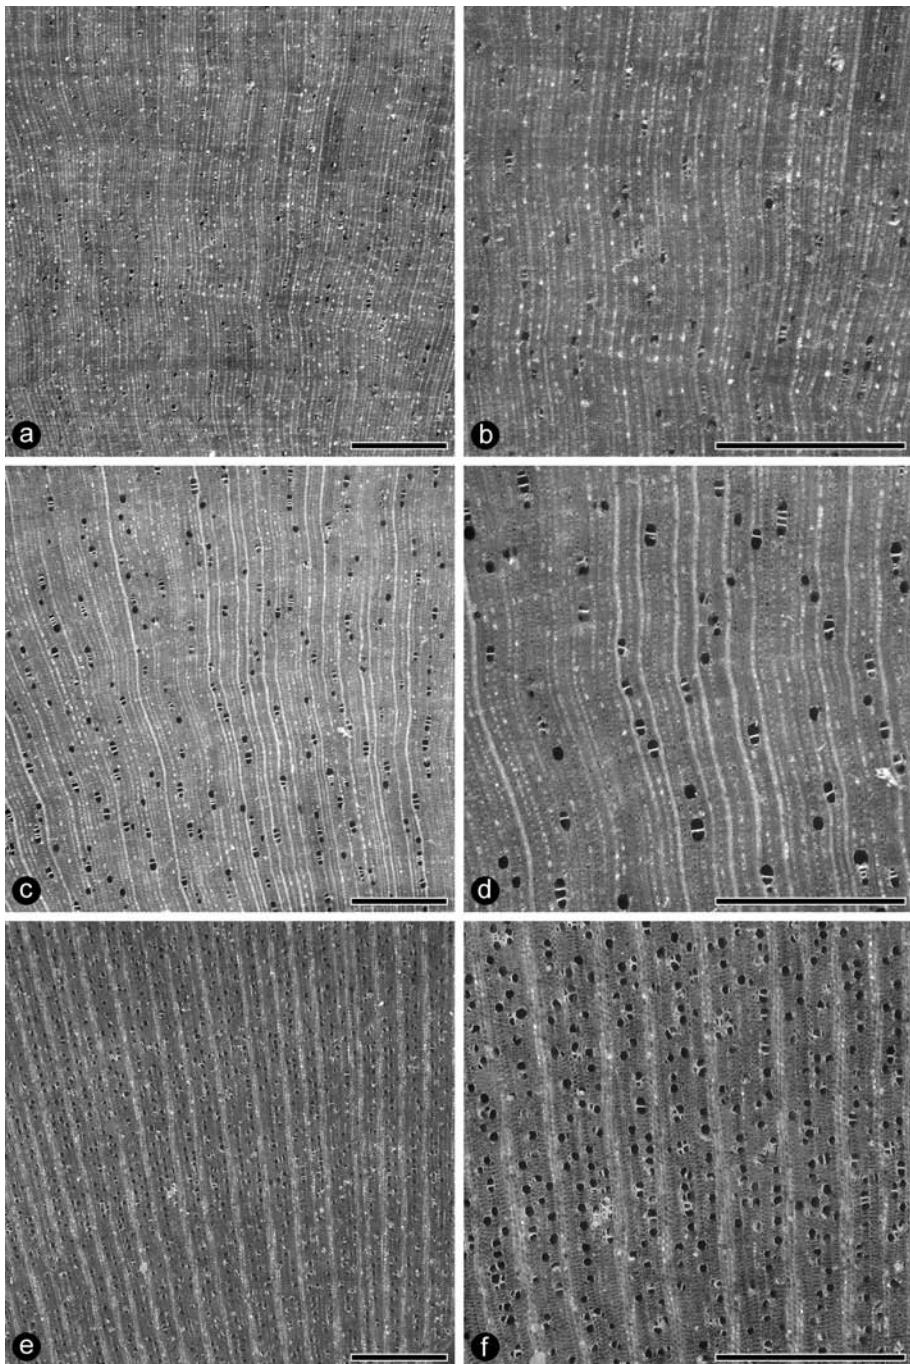

Fig. 61. a, b: *Pausandra trianae* (Uw 7483). – c, d: *P. trianae* (Uw 19974). – e, f: *Pentabrachion reticulatum* (Uw 14605). – Bar = 1 mm.

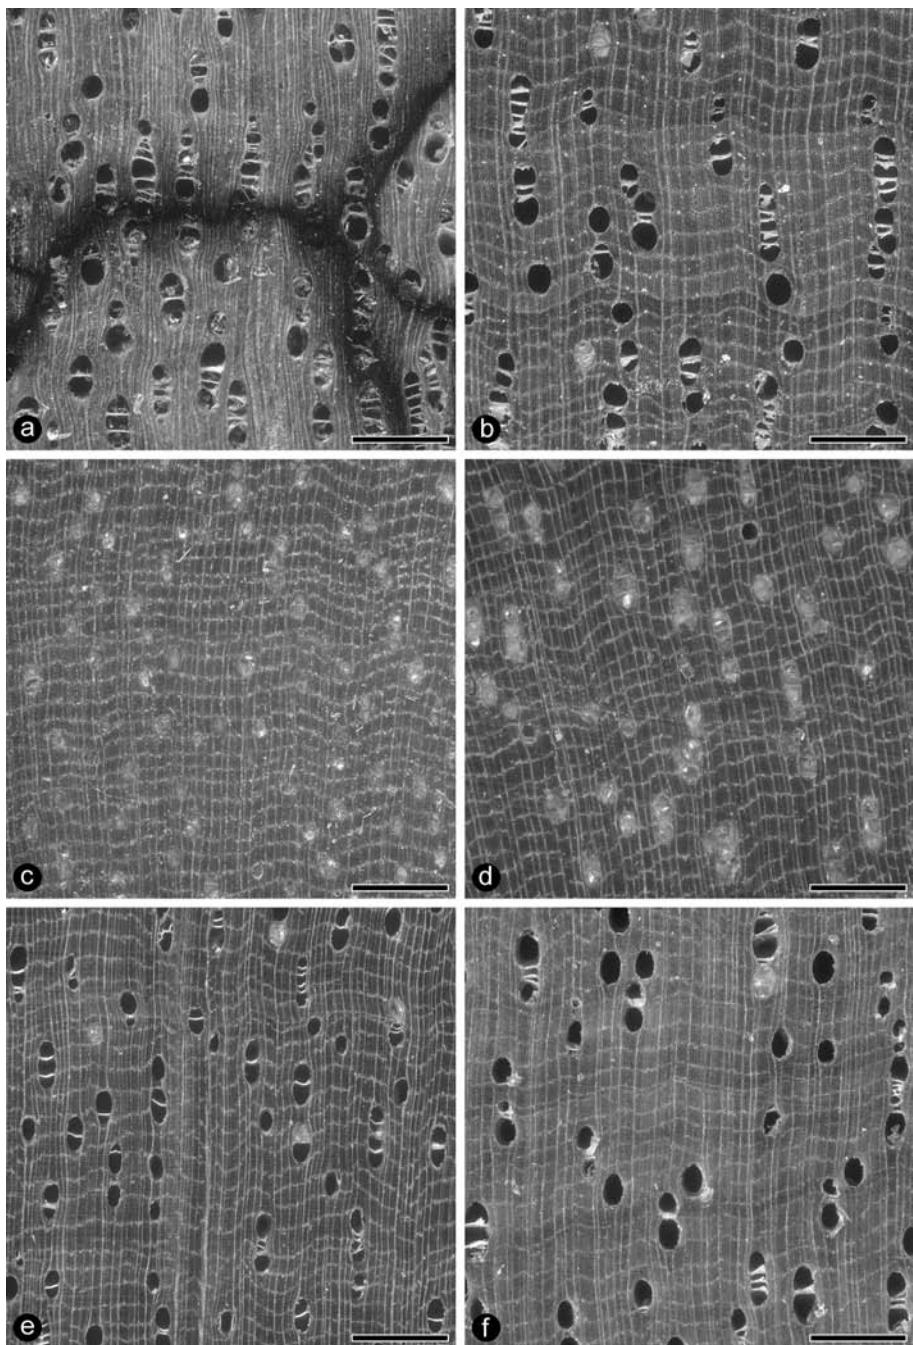

Fig. 62. a: *Pera arborea* (Uw 22247). – b: *P. bicolor* (Uw 82). – c: *P. bumeliifolia* (Uw 31985). – d: *P. cinerea* (Uw 19416). – e: *P. coccinea* (Uw 8190). – f: *P. decipiens* (Uw 8034). – Bar = 1 mm.

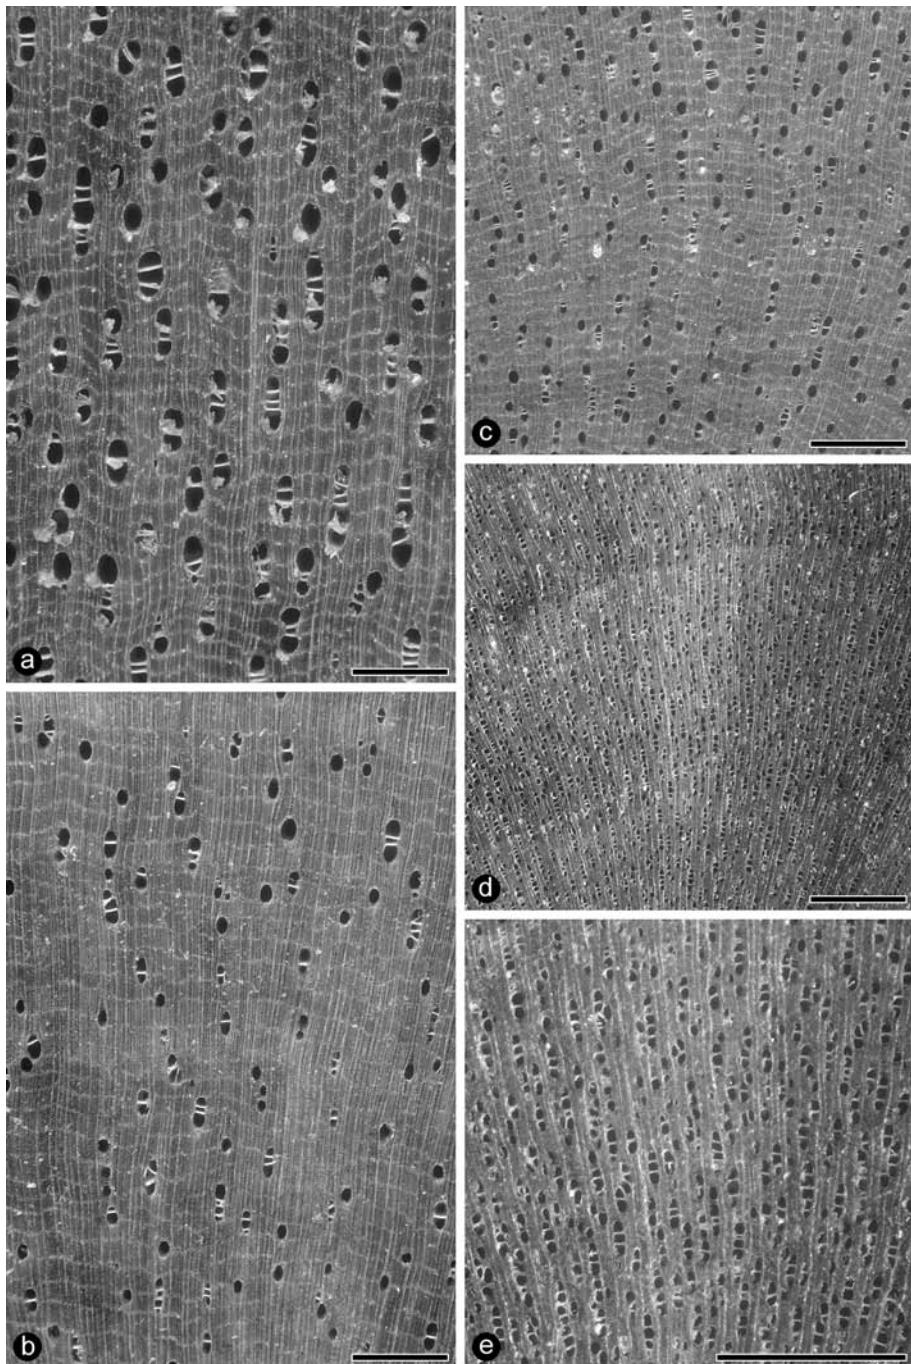

Fig. 63. a: *Pera glabrata* (Uw 17587). – b: *P. glabrata* (Uw 19159). – c: *P. obovata* (Uw 6955). – d, e: *Petalostigma cf. pubescens* (Uw 31201). – Bar = 1 mm.

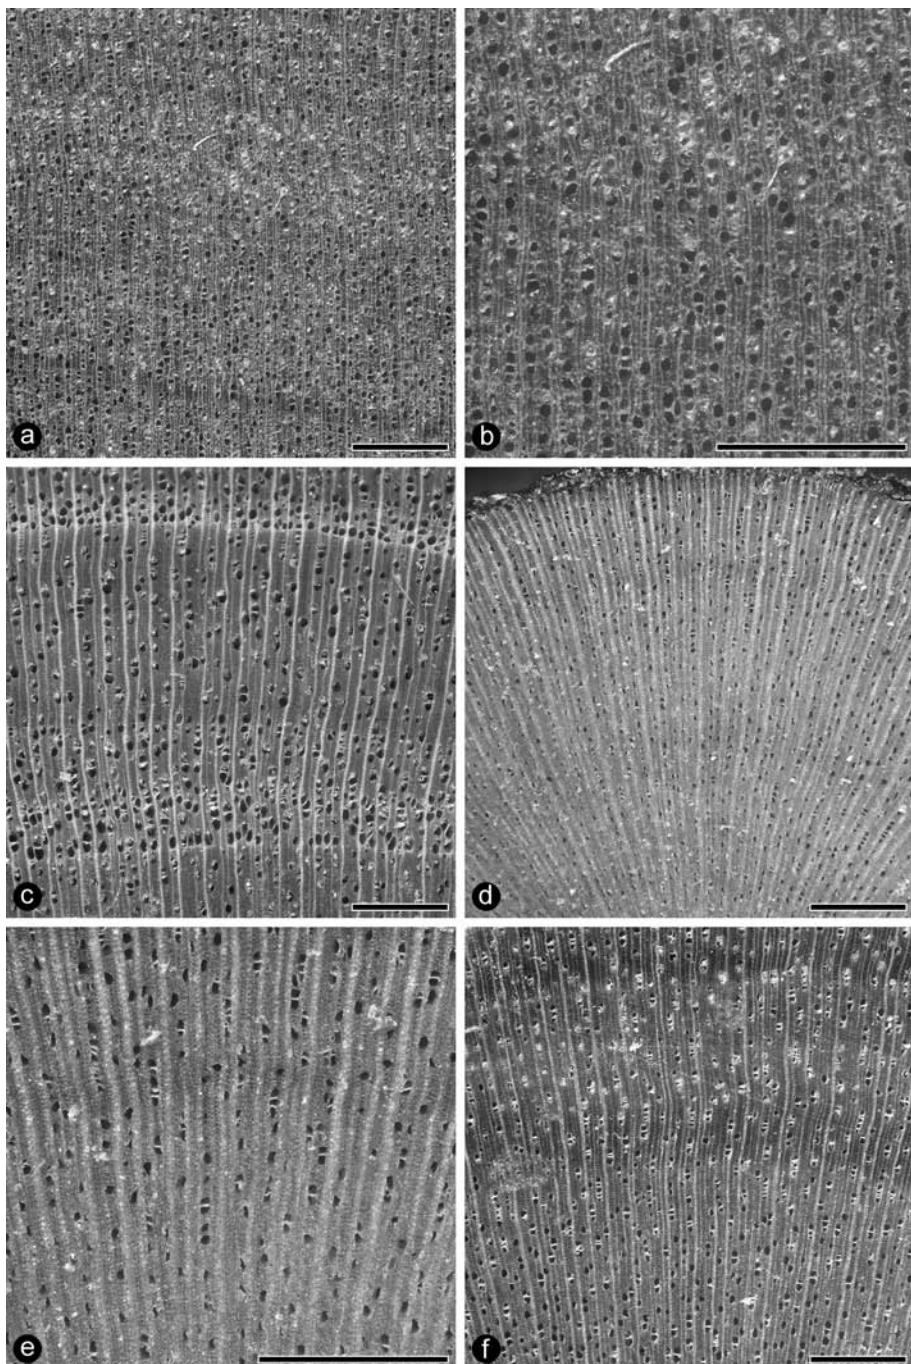

Fig. 64. a, b: *Petalostigma quadriloculare* (Uw 10948). – c: *Phyllanthus acuminatus* (Uw 11853). – d, e: *P. adiantoides* (Uw 32178). – f: *P. attenuatus* (Uw 6655). – Bar = 1 mm.

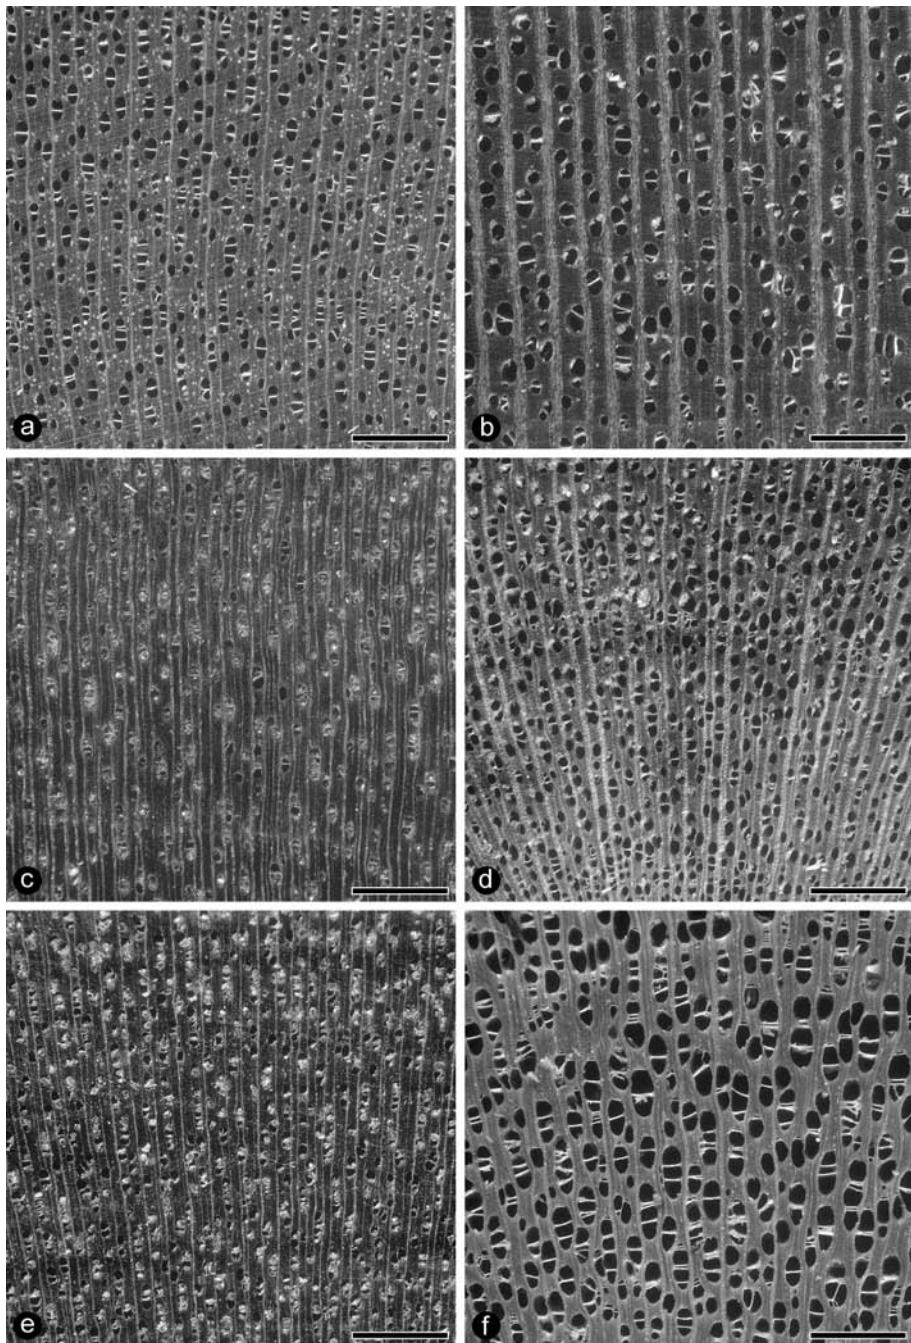

Fig. 65. a: *Phyllanthus cladotrichus* (Uw 19852a). – b: *P. emblica* (Uw 21399). – c: *P. indicus* (Uw 10905). – d: *P. juglandifolius* subsp. *cornifolius* (Uw 31189). – e: *P. madeirensis* (Uw 8204). – f: *P. muellerianus* (Uw 9437). – Bar = 1 mm.

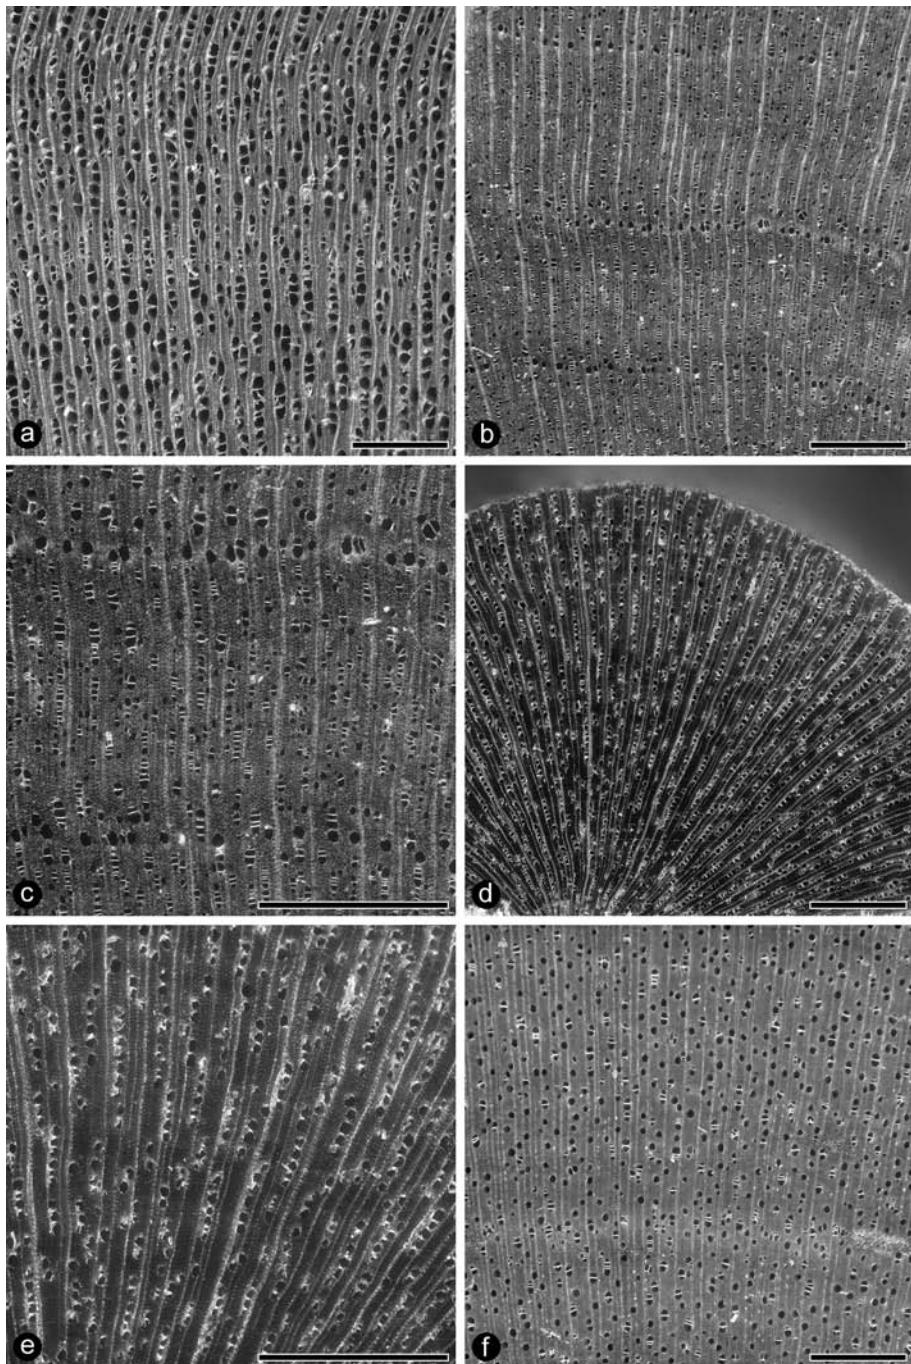

Fig. 66. a: *Phyllanthus salviifolius* (Uw 10999). – b, c: *P. sellowianus* (Uw 14074). – d, e: *P. vacinifolius* (Uw 27338). – f: *P. valleanus* (Uw 25113). – Bar = 1 mm.

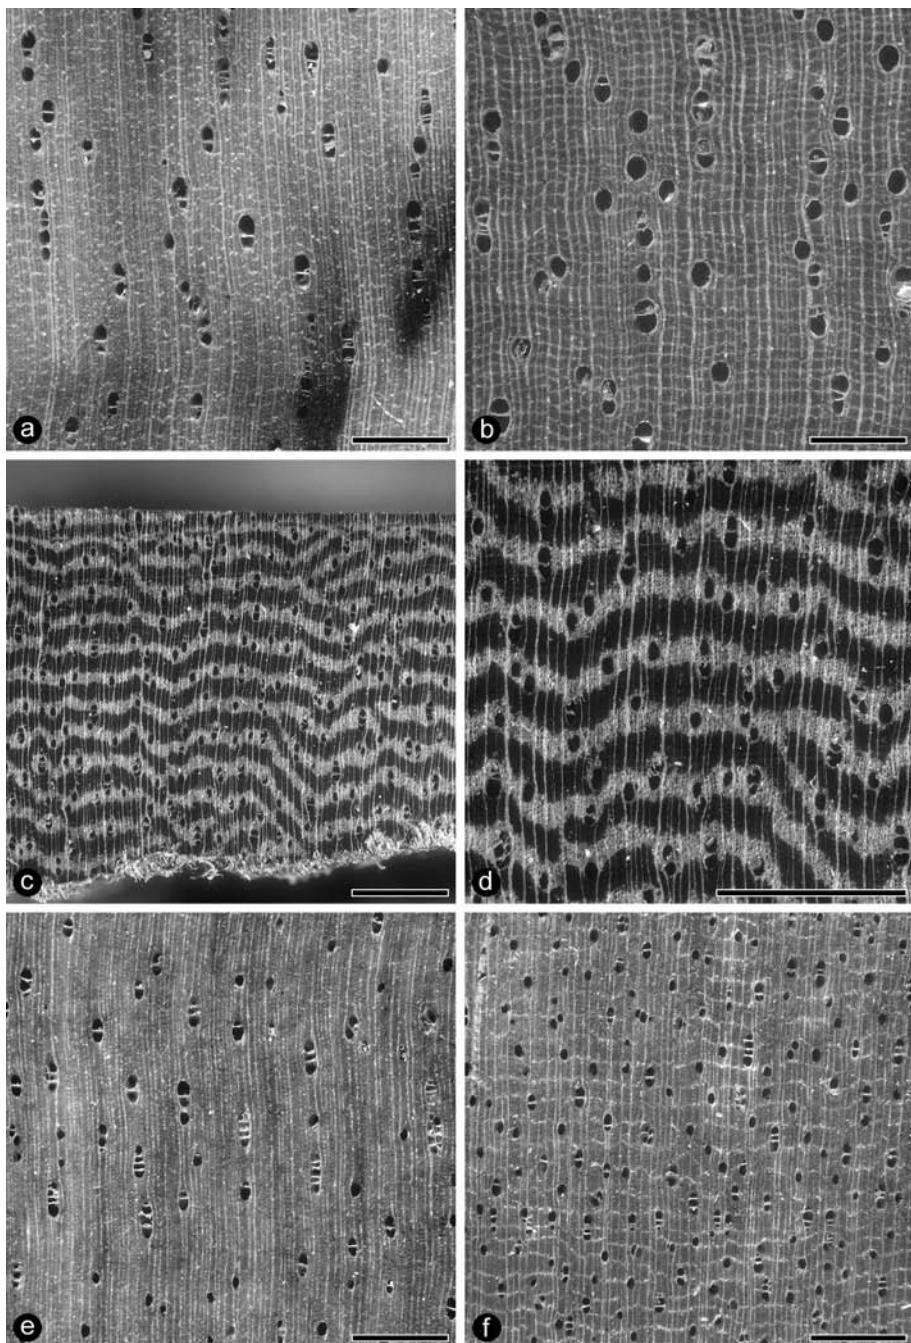

Fig. 67. a: *Pimelodendron amboinicum* (Uw 18197). – b: *P. papuanum* (Uw 18125). – c, d: *Piranhea trifoliata* (Uw 7524). – e. *Plagiostyles africana* (Uw 22184). – f: *Pleradenophora longicuspis* (Uw 18022). – Bar = 1 mm.

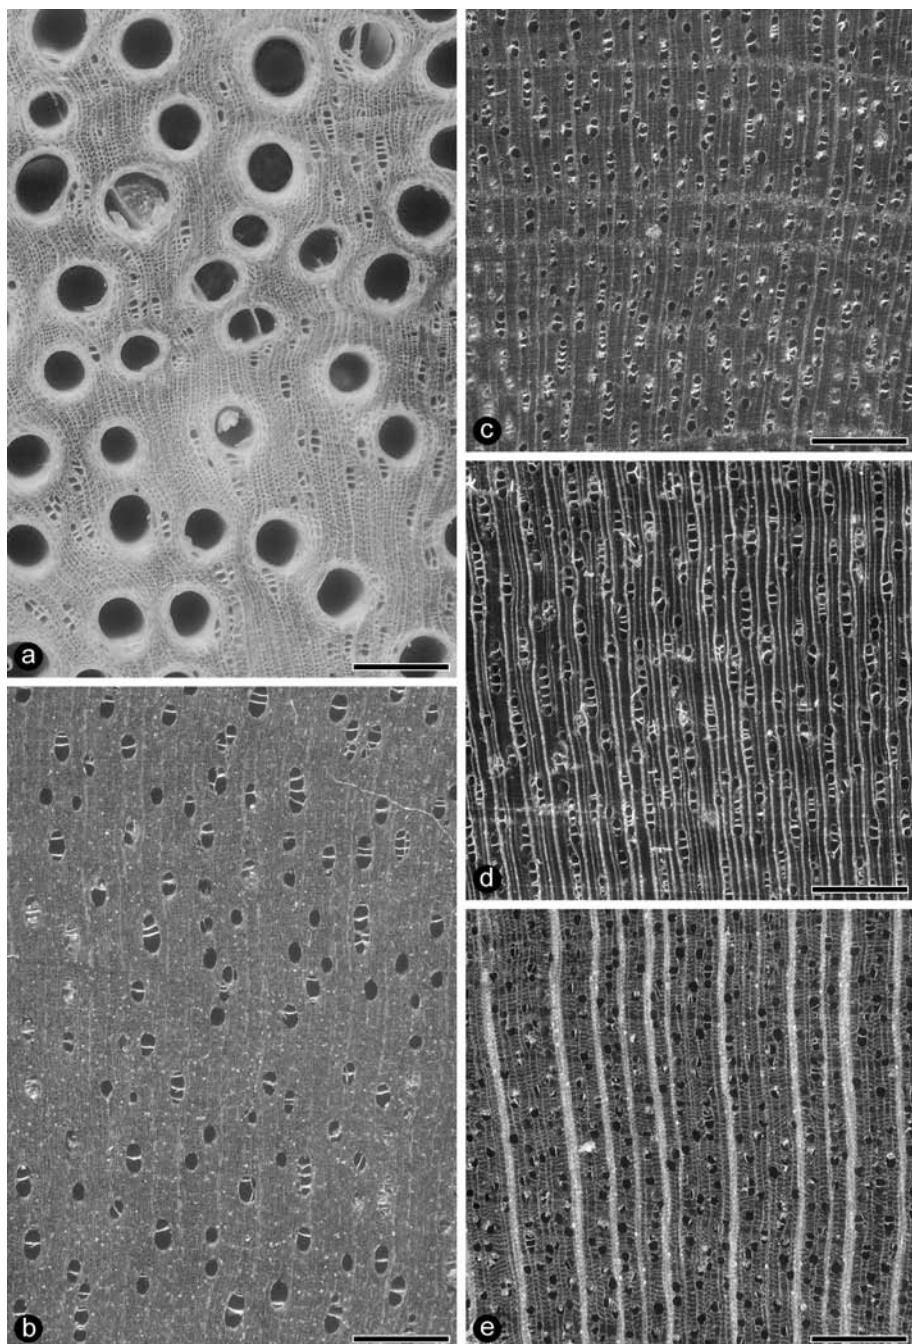

Fig. 68. a: *Plukenetia polyadenia* (Uw 11789). – b: *Podadenia javanica* (Uw 21371). – c: *Pogonophora schomburgkiana* (Uw 296). – d: *P. schomburgkiana* (Uw 9671). – e: *Protomegabaria stapfiana* (Uw 14639). – Bar = 1 mm.

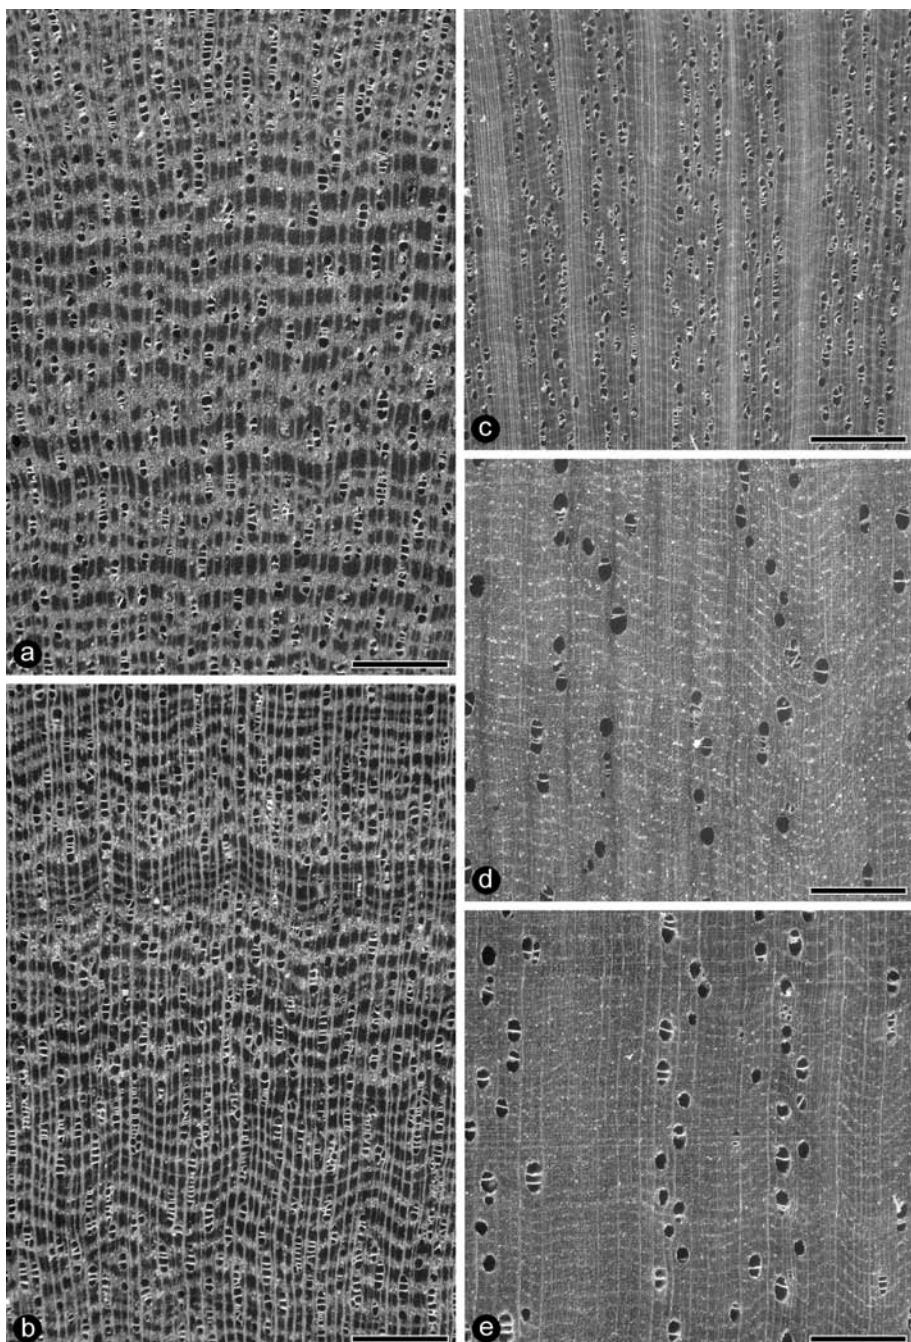

Fig. 69. a: *Pseudolachnostylis glauca* (Uw 15645). – b: *P. maprouneifolia* (Uw 11057). – c: *Pseudoseneffleria inclinata* (Uw 14652). – d: *Ptychopyxis costata* (Uw 21372). – e: *P. costata* (Uw 21421). – Bar = 1 mm.

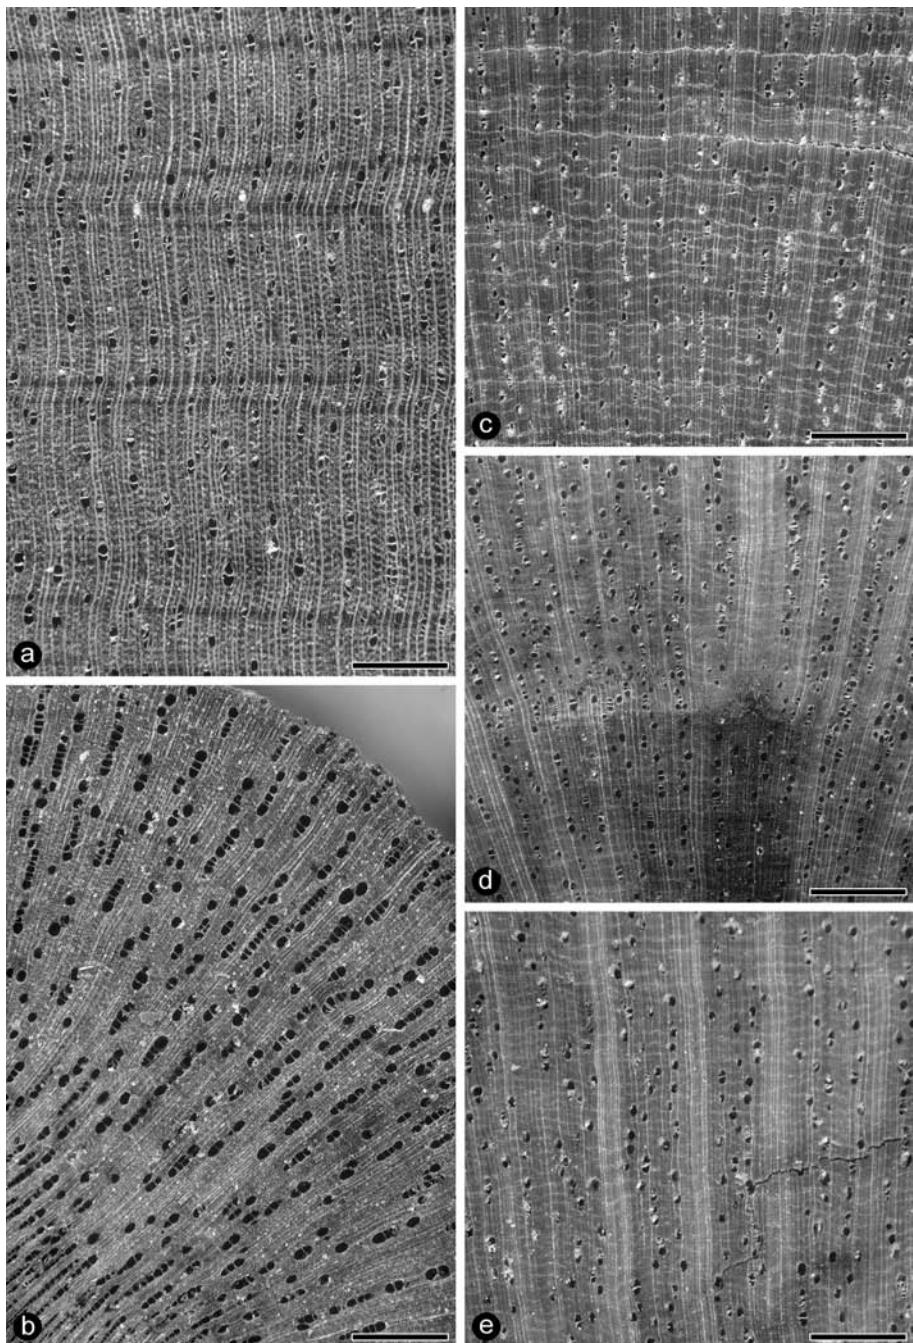

Fig. 70. a: *Putranjiva roxburghii* (Uw 10908). – b: *Reutealis trisperma* (Uw 31310). – c: *Rhodothyrsus macrophyllus* (Uw 8208). – d: *R. macrophyllus* (Uw 34037). – e: *R. macrophyllus* (Uw 36055). – Bar = 1 mm.
